Revision Summary

Revision Number	Summary of Revisions
1 (February 2021)	Revised in response to comments from New Jersey Department on Environmental Protection (NJDEP) comment letter dated 2/4/2021 (Ralph Rodrigues, NJDEP Emergency Management Program)
2 (April 2021)	Revised in response to backcheck comments in NJDEP letter dated 4/8/2021 (Ralph Rodrigues, NJDEP Emergency Management Program)
3 (May 2021)	Revised Figure 8-1 in response to backcheck comments in NJDEP letter dated 5/19/2021 (Ralph Rodrigues, NJDEP Emergency Management Program)

Executive Summary

ES.0.1 The purpose of this remedial investigation (RI) is to characterize the nature and extent of munitions and explosives of concern (MEC) and hazardous and toxic waste (HTW) related to known or documented U.S. Department of Defense (DoD) releases, and to perform human health and ecological risk evaluations for Areas 6, 6A, 6B and Dredge Spoil Area (DSA) 1 at the Former Raritan Arsenal (former Arsenal). Areas 6, 6A, and 6B encompass a total of approximately 130 acres along the east side of the former Raritan Arsenal (Figure ES-1). The land now identified as Area 6 encompasses 125 acres of marshy land southwest of Subareas 6A and 6B (Figure ES-2). Subareas 6A and 6B cover a total of 4.56 acres of land that is separated by Black Ditch, a drainage ditch that discharges into the Raritan River. DSA 1 covers 89 acres, and extends beneath the eastern side of Subarea 6, all of Subarea 6A, and an additional approximately 40 acres that extends northwest of Subarea 6A, between Subareas 6 and 6B.

ES.0.2 When originally delineated in 1963, Area 6 only consisted of the land areas that are now identified as Subareas 6A and 6B. These two areas were initially investigated because they were used as burning grounds for various ammunition components up to and including the former Arsenal closeout in 1963 (Dames & Moore, Inc. [Dames & Moore], 1993b). The third, larger subarea now identified as Area 6 was subsequently delineated because it contains impoundments, or short walls presumably designed for containment of dredge spoils from the Raritan River. The impoundments were identified through a review of historical aerial photographs, and the boundary for this area is first identified on maps prepared for the Phase II RI Work Plan (Roy F. Weston, Inc. [Roy F. Weston], 1993). DSA 1 lies within the limits of the dredge disposal areas shown on historical maps, and was reportedly filled with dredge material from the Raritan River channel boundary between approximately 1940 and 1956. Because Raritan River dredging operations included dredging the river bottom in front of the former Arsenal dock, which according to historical reports contained MEC, the dredge spoils disposed in DSA 1, within Areas 6 and 6A, was thought to potentially contain MEC (Weston Solutions, Inc. [Weston], 2007).

ES.0.3 No MEC items were identified during previous investigation of Areas 6, 6A, and 6B. Previous MEC inspections focused primarily on Subareas 6A and 6B, the former burning grounds. On three separate occasions portions of Subareas 6A and 6B were disked to 6 inches and searched and cleared of ordnance material. During the 1963 Letterkenny Army Depot (LEAD) decontamination study, Subareas 6A and 6B were cleared by LEAD with rakes, and subsequently recommended for unrestricted use. A visual inspection with spot checks using an ordnance detector conducted in 1988, in preparation for advancement of soil borings, yielded no ordnance (O'Brien & Gere, Inc. [O'Brien & Gere], 1989). However, during a clearance investigation performed for Dames & Moore in 1991/1992, some inert ordnance components, including three bomb vanes and several small ordnance fragments, were discovered in the southern portion of Subarea 6A (Dames & Moore, 1993b). In 1993, 805 anomalies were identified during geophysical investigation of four 100-foot by 50-foot subareas in and around Subareas 6A and 6B. Two of the subareas were located within Subarea 6A, one was located in Subarea 6B, and one was located within DSA 1 between Subareas 6A and 6B (Figure ES-2). Intrusive investigation of 200 anomalies (approximately 25 percent) identified only inert munitions components (bomb fins).

ES.0.4 There are no documented spills or known disposal-type releases of munitions constituents (MC) or HTW associated with DoD activities that occurred within Areas 6, 6A, 6B, and DSA 1. However, non-DoD releases did occur within Subarea 6A, which was used by a non-DoD former sulfuric acid manufacturing plant (LaPlace, Inc.), constructed in 1966 and demolished, with land cleared, in 1997. An initial evaluation of Subareas 6A and 6B in 1988 (O'Brien & Gere, 1989) included collection of three surface and nine subsurface soil samples and analysis for volatile organic compounds (VOCs), metals, and explosives. Arsenic was detected at a concentration exceeding the New Jersey Department of Environmental Protection (NJDEP) residential cleanup criterion in one subsurface soil collected from Subarea 6A. No other constituents were detected at concentrations exceeding NJDEP cleanup criteria.

ES.0.5 In 1992, surface and subsurface soil samples were collected from 20 soil borings in Subarea 6A and four soil borings in Subarea 6B, and surface water and sediment samples were collected from three locations in Subarea 6A for the Phase I RI (Dames & Moore, 1993). Samples were analyzed for VOCs, semivolatile organic compounds (SVOCs), metals, and explosives. Surface water and sediment samples were also analyzed for pesticides. Metals (arsenic, cadmium, and lead) detected in samples collected from multiple locations were the only constituents detected at elevated concentrations in soil samples. The explosive compounds nitroglycerin and pentaerythritol tetranitrate (PETN) were detected in one surface water sample, and one sediment sample contained the pesticide dichlorodiphenyl trichloroethane (DDT) at a concentration exceeding the screening criterion. No other VOCs, SVOCs, metals, explosives, or pesticides were detected at concentrations exceeding screening criteria in surface water or sediment samples.

ES.0.6 Data collected from more than 68 additional soil samples, 29 surface water, and 19 sediment samples were collected from Areas 6, 6A, and 6B in 1994 for the Phase II RI. The samples were analyzed for various parameters, including VOCs, SVOCs, pesticides, polychlorinated biphenyls (PCBs), and metals. Analytical results indicated that concentrations of detected constituents were generally consistent across Areas 6, 6A, and 6B, and not suggestive of a DoD source area.

ES.1 Munitions and Explosives of Concern Investigation Summary

ES.1.1 For this RI, a MEC investigation was performed across DSA 1 to evaluate the presence of MEC (Figure ES-3). Digital geophysical mapping (DGM) transects were conducted along 3-meter-wide transects spaced at 80-meter intervals within DSA 1. In addition, a series of 1-meter-wide transects spaced at 3-meter intervals was placed across an area of potential pits identified between Areas 6 and 6A on a 1963 aerial photograph and identified in the 1993 archival search (Dames & Moore, 1993). A geostatistical analysis was performed on the anomalies detected to map anomaly densities and identify any clustering of metallic items.

ES.1.2 A total of 318 anomalies potentially representing MEC/material potentially presenting an explosive hazard (MPPEH) were identified from the DGM survey along the transects at DSA 1. Based on the statistical assessment performed, 205 of 318 anomalies were investigated to confirm if the anomalies were related to MEC/MPPEH, with the addition of four anomalies related to quality control seed items. Munitions debris was recovered from 6 anomaly locations at DSA 1 at depths between 3 and 10 inches below ground surface (bgs). Items included thin-walled rifle grenades (one each at three locations), one rifle grenade body and scrap, rifle grenade flares (seven at one location, expended, no filler), and one expended grenade fuze. All items were certified as material documented as safe (MDAS). The remainder of the sources of anomalies investigated at DSA 1 were non-munitions-related items. Further details are provided in the report and Appendix G.

ES.1.3 MC sampling was not performed because no breached or degraded MEC items were recovered.

ES.2 Hazardous and Toxic Waste Nature and Extent Investigation Summary

ES.2.1 In 1994 and 2005, environmental investigations performed related to MC and HTW included the analysis of soil, sediment, and surface water samples collected at Areas 6, 6A, and 6B for parameters including VOCs, SVOCs, dioxins and furans, pesticides, PCBs, metals, and explosives. Isolated detections of SVOCs, metals, dioxins/furans, and heptachlor epoxide above their respective screening levels were identified in soil samples, and trichloroethene, SVOCs, dioxins and furans, Aroclor-1260, and metals were detected in sediment and/or surface water above their respective screening levels. Results of

ecological and human health risk assessments indicate the potential risk for these constituents in surface, subsurface soil, sediment, and surface water are within the U.S. Environmental Protection Agency's acceptable cancer risk management range of 1 to 100 in a million (1×10^{-6} to 1×10^{-4}) and below a target organ hazard index (HI) of 1 for current/future receptors.

ES.2.2 A quantitative risk assessment was conducted using the existing MC and HTW data collected in 1994 and 2005. Detections of MC were evaluated against facility-wide levels and background concentrations to quantify the potential risk associated with soil, sediment, and surface water at Areas 6, 6A, and 6B. Soil sampling performed at DSA 1 indicated that MC was not detected at concentrations that would suggest a release.

ES.3 Human Health Risk Assessment Summary

ES.3.1 A baseline human health risk assessment (HHRA) was conducted as part of this RI for Areas 6, 6A, and 6B and DSA 1 to estimate the potential risks to human receptors associated with exposures to constituents detected in surface soil (0 to 2 feet bgs), subsurface soil (2 to 7.7 feet bgs), surface water, and sediment within Areas 6, 6A, 6B, and DSA 1. The potential receptors evaluated in the HHRA included current/future maintenance workers and future recreational users/trespassers, industrial workers, construction workers, and hypothetical residents. Potential exposures to soil through ingestion, dermal contact, and inhalation were estimated for all receptors. Additionally, potential exposures to surface water and sediment through ingestion and dermal contact were evaluated for recreational users/trespassers.

ES.3.2 Potential cancer risks and non-carcinogenic hazards were estimated for constituents identified as chemicals of potential concern (COPCs) in each exposure medium. Additionally, background-related risks were calculated for the soil inorganic COPCs to determine the potential risks attributable to background rather than a DoD-release. The estimated site excess lifetime cancer risks (ELCRs) were less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated site hazard indices (HIs) for each target organ were less than or equal to EPA's threshold of 1 for potential maintenance workers, recreational users/trespassers, industrial/commercial workers, and construction/utility workers. For a residential scenario, the estimated site ELCR for surface soil exceeded the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated HIs for surface and total soil exceeded EPA's threshold of 1. The ELCR and HI exceedances were primarily from arsenic in site soil. Arsenic concentrations in site soil were not statistically greater than background concentrations, based on the results of a two-sample randomization (permutation) test. After removing the background contributions for arsenic in site soil, the estimated ELCRs and HIs are within acceptable levels for a residential scenario. Therefore, no constituents of concern (COCs) attributable to a DoD release were identified for soil, sediment, or surface water at Areas 6, 6A, 6B and DSA 1.

ES.4 Ecological Risk Assessment Summary

ES.4.1 A baseline ecological risk assessment (BERA) addendum was not completed to evaluate the potential for ecological risk from DoD-related activities at Areas 6, 6A, and 6B because the site was previously evaluated as part of the Red Root Creek and Black Ditch drainage systems during the sitewide BERA (Weston, 2008). The sitewide BERA results did not indicate any site-related potential for ecological risk associated with Areas 6, 6A, and 6B. Accordingly, no further evaluation is recommended.

ES.5 MEC Risk Management Methodology Evaluation

ES.5.1 Human health risk due to the possible presence of MEC at Area 6, 6A, 6B, and DSA 1 was evaluated using the MEC Risk Management Methodology at Formerly Used Defense Sites. Using this methodology, the overall risk for the site was deemed acceptable, based on a combination of low

likelihood of encountering MEC, low severity of unintentional MEC detonation, and modest likelihood to impart energy. The modified MEC conceptual site model reflects an incomplete MEC exposure pathway for all current and future receptors.

ES.6 Conclusions

ES.6.1 Areas 6, 6A, 6B, and DSA 1 consist of predominantly undeveloped wetlands, across which multiple investigations have been conducted. No MEC were identified historically or during the recent intrusive investigation completed as part of this RI, and no DoD-related constituents were identified in soil, sediment, or surface water that pose an unacceptable risk to current and future receptors. An evaluation of the site scored the human health risk due to the possible presence of MEC at Areas 6, 6A, 6B, and DSA 1 as “Acceptable.” No further action is recommended for MEC or MC and HTW associated with Areas 6, 6A, 6B and DSA 1 based on an evaluation of the data previously collected and as presented in this RI.

Introduction

1.1 Purpose and Scope

1.1.1 The Former Raritan Arsenal (former Arsenal) in Edison, New Jersey, constitutes one munitions response area (MRA) that includes several areas of interest that are in various stages of investigation or remediation (Figure 1-1). CH2M HILL, Inc. (CH2M) performed a remedial investigation/feasibility study (RI/FS) that was focused on Areas 1, 6, 6A, 6B, 9, 10, 11, 12, 13, 16, 18D, 19, and Dredge Spoil Areas (DSAs) 1 through 6 at the former Arsenal (Tables 1-1 and 1-2).

1.1.2 The purpose of this RI is to characterize the nature and extent of munitions and explosives of concern (MEC) and hazardous and toxic waste (HTW) related to known or documented U.S. Department of Defense (DoD) releases, and to provide human health and ecological risk assessments for Areas 6, 6A, 6B, and DSA 1 at the former Arsenal (Figure 1-2). Areas 6, 6A, and 6B are located in the southeastern portion of the former Arsenal, and consist of a former impoundment area (Subarea 6) and former burning grounds (Subareas 6A and 6B). DSA 1 lies within the limits of the dredge disposal areas shown on historical maps, and was reportedly filled with dredge material from the Raritan River channel boundary between approximately 1940 and 1956. Because Raritan River dredging operations included dredging the river bottom in front of the former Arsenal dock, which according to historical reports contained MEC, the dredge spoils disposed in DSA 1, extending beneath Areas 6 and 6A, may also contain MEC (Weston Solutions, Inc. [Weston], 2007).

1.1.3 Munitions constituents (MC) and HTW data collected during historical investigations at Areas 6, 6A, and 6B beginning in 1988 (Table 1-3) indicated that detections of polycyclic aromatic hydrocarbons (PAHs) and metals at concentrations that exceed background concentrations or U.S. Environmental Protection Agency (EPA) regional screening levels (RSLs) are generally widespread across Areas 6, 6A, and 6B at similar concentrations that cannot be directly attributed to DoD-related activities. Additionally, the majority of Areas 6, 6A, and 6B is estuarine environment that was evaluated in the baseline ecological risk assessment (BERA; Weston, 2008) as part of the Red Root Creek and Black Ditch drainage systems. The BERA concluded that, with few exceptions, there were no significant impacts to ecological receptors evaluated within estuarine environments located on the former Arsenal.

1.1.4 Because no focused MEC investigations were historically performed outside of the former burning grounds (Subareas 6A and 6B), additional investigation was required to define the nature and extent of MEC associated with the previously defined extent of dredge spoils (Roy F. Weston, Inc. [Roy F. Weston], 1997) that lie beneath a portion of Area 6, all of Subarea 6A, and much of the land area between Area 6 and Subarea 6B (Subarea 6B is not known to be underlain by dredge deposits). An intrusive investigation of geophysical anomalies was completed in 2014 to address this data gap. This document provides the results of investigations conducted at Areas 6, 6A, 6B, and DSA 1, and includes assessment of MC in soil, sediment, and surface water and a MEC risk evaluation using the January 3, 2017 Trial Period for Risk Management Methodology at Formerly Used Defense Sites (FUDS) Military Munitions Response Program (MMRP) Projects. The RI is supplemented with a quantitative human health risk assessment (HHRA) using existing MC and HTW data collected in 1994 and 2005.

1.1.5 The RI was performed under the Defense Environmental Restoration Program for FUDS. This document was prepared in accordance with the Performance Work Statement, Revision 2, dated September 28, 2014, for the U.S. Army Engineering and Support Center, Huntsville, Alabama, as part of Contract Number W912DR-09-D-0060, Task Order 003, and the U.S. Army Corps of Engineers (USACE) New York and New England Districts using Data Item Description Worldwide Environmental Remediation Services (WERS)-001, USACE Engineer Regulation 200-3-1 (USACE, 2004), the June 2007

USACE Engineer Manual (EM) 1110-1-4009 (USACE, 2007), USACE EM 385-1-1 (USACE, 2008a), USACE EM 385-1-97 (USACE, 2008b), and DoD Manual 4715.20 (DoD, 2012), and in accordance with the *Remedial Investigation/Feasibility Study Work Plan, Former Raritan Arsenal, Edison, New Jersey* (RI/FS Work Plan, Final (Revision 3; CH2M, 2016).

1.2 Property Description

1.2.1 The former Arsenal is located in Middlesex County, New Jersey, on the north bank of the Raritan River. Most of the land area lies within Edison Township; a small portion lies within Woodbridge Township. The former Arsenal is bordered to the north and northwest by Woodbridge Avenue, to the southwest by Mill Road, and to the south and east by the Raritan River (Figure 1-1).

1.2.2 Areas 6, 6A, and 6B encompass a total of 130 acres along the east side of the former Raritan Arsenal. The land now identified as Area 6 encompasses 125 acres of marshy land separate from and southwest of Subareas 6A and 6B. Subareas 6A and 6B cover a total of approximately 4.56 acres of land that is separated by Black Ditch, a drainage ditch that discharges into the Raritan River. DSA 1 covers approximately 89 acres, and extends beneath the eastern side of Area 6, all of Subarea 6A, and an additional approximately 40 acres between Areas 6 and 6A that extend west of Area 6 and northwest of Subarea 6B (Figure 1-1). Almost all of the land in Areas 6, 6A, and 6B is undeveloped marsh, with the exception of the demolished remnants of a sulfuric acid plant formerly located in Subarea 6A, which is currently a shipping facility parking lot.

1.2.3 When originally delineated in 1963, Area 6 consisted only of the land areas that are now identified as Subareas 6A and 6B. These two areas were investigated because they were used as burning grounds for various ammunition components up to and including the former Arsenal closeout in 1963 (Dames & Moore, 1993b). The third, larger subarea now identified as Area 6 was delineated because it contains impoundments, or short walls presumably designed for containment of dredge spoils from the Raritan River. The impoundments were identified through a review of historical aerial photographs, and the boundary for this area is first identified on maps prepared for the Phase II RI Work Plan (Roy F. Weston, 1993). DSA 1 lies within the limits of the dredge disposal areas shown on historical maps, and was reportedly filled with dredge material from the Raritan River channel boundary between approximately 1940 and 1956. Historical photographs show three large areas in the southwestern portion of Area 6 that may have been used as dredge material impoundments, existing from at least 1939 to 1967 (Roy F. Weston, 1997). Because Raritan River dredging operations included dredging the river bottom in front of the former Arsenal dock, which according to historical reports contained MEC, the dredge spoils disposed in Area 6, 6A, and DSA 1 may also contain MEC (Figures 1-1 and 1-2).

1.3 Historical Information

1.3.1 Former Arsenal

1.3.1.1 The former Arsenal was initially developed to facilitate military shipments during World War I (Weston, 2007). The land purchased for development of the former Arsenal consisted of approximately 2,100 acres of tidal marsh, quarries, and farmland. The War Department assumed control of the land in December 1917, and arsenal construction was underway by the beginning of 1918. Ordnance was first received at the former Arsenal during the early phases of construction. On May 2, 1918, the former Arsenal was declared operational. Military facilities at the former Arsenal included magazines, a railway network, locomotive houses, docks, warehouses, assembly and process buildings, administration buildings, storage buildings, and living quarters.

1.3.1.2 The principal function of the former Arsenal was to store, handle, and ship various classes of ordnance and military supplies. Other activities and missions included:

- Assembly of automobiles, trucks, tanks, and motorized artillery
- Preservation, renovation, and manufacture of munitions
- Salvaging, linking, belting, clipping, packing, demilitarizing, and maintaining ammunition
- Requisition, research, and development of ordnance
- Military supply chain management
- Troop training

1.3.1.3 In March 1961, DoD announced the proposed disposition of the former Arsenal. A decontamination study of the former Arsenal was conducted in 1963 as part of the decommissioning process. The study was begun under the direction of Arsenal personnel and was completed under the direction of personnel from Letterkenny Army Depot (LEAD) and the Army Materiel Command Safety Office. During this study, LEAD identified 17 areas within the former Arsenal as potentially contaminated by ordnance-related activities (Dames & Moore, 1993a). Subareas 6A and 6B were identified as Area 6 at this time. Standard operating procedures for decontaminating the original 17 areas were prepared, approved by the Safety Branch, and carried out during closure of the former Arsenal. Decontamination of the 17 areas was completed in October 1963. Other investigation areas were identified during investigations performed after the initial 1963 decontamination inspection.

1.3.1.4 In 1964, the General Services Administration (GSA) began selling off the Arsenal property. At the time of the disposition announcement, the Arsenal had expanded to approximately 3,200 acres, with approximately 440 buildings and more than 62 miles of roads and railways. Since closure, the former Arsenal has been redeveloped extensively, primarily for commercial and industrial uses, especially in the northern portion of the facility.

1.3.2 Area 6

1.3.2.1 Based on historical aerial photographs, three large areas extending along the Area 6 overlap with DSA 1 were identified as potential impoundments, existing from at least 1939 to 1967. The photographs indicated the presence of walls (or dikes) a few feet high, suggesting designed containment. These Area 6 historical impoundments have been observed during field efforts as low-rising mounds of fill soil. The actual purpose of these impoundments is unknown, but based on information obtained from the Archival Search Report (Dames & Moore, 1993b), this area received relocated fill material from other Raritan Center locations (specifically, 100 and 200 Fernwood and Northfield Avenues) and dredge material from the Raritan River (Figure 1-2).

1.3.3 Subareas 6A and 6B

1.3.3.1 Historical records report that portions of Subareas 6A and 6B were used as burning grounds for demilitarization of ammunition components. Interviews conducted during the compilation of the Archival Search Report (ASR) indicated that from 1941 to 1948 these areas may have also been used as a burning ground for explosives. Historical records do not state specifically when or where the burning took place, but aerial photographs from the 1950s and 1960s show more intensive use of Subarea 6A than 6B, and two pits in the photographs appear less than 100 yards beyond the southwest boundary of Area 6A (Dames & Moore, 1993a).

1.3.3.2 In 1966, after the disposition of all former Arsenal property by the U.S. Army, a sulfuric acid manufacturing plant was constructed on Subarea 6A by Laplace, Inc. Reportedly, there were numerous spills from this production unit, and evidence of past spills included sulfur staining on the ground surface and stressed vegetation around the former plant (Roy F. Weston, 1997). The facility was shut down and demolished in 1997, except for some remaining structures that are now used for a shipping facility parking lot. The remainder of the subarea is undeveloped marshland (Roy F. Weston, 1997).

1.3.3.3 In addition to reported previous use as burning grounds described above, Subarea 6B is characterized by the presence of mounds of soil that are reported to be dredge material from Black Ditch, or soil related to FBC construction activities within the Raritan Center Industrial Park. Pieces of asphaltic concrete have also been observed in and around these mounds. Distribution of these mounds in Subarea 6B falls roughly into two clusters, generally, aligned between the northern border of Black Ditch and East Patrol Road.

1.3.4 DSA 1

1.3.4.1 DSA 1 was established by USACE in April 2012 during development of the RI/FS Work Plan (CH2M, 2016) as previous investigation data and historical reports documented the presence of fill material across various areas of the former Arsenal that appear to be dredge spoils from the Raritan River (Weston, 2002). For purposes of the investigation, USACE divided the DSA into six individual areas, identified as DSAs 1 through 6 (Figure 1-1). Boundaries between the DSAs on the former Arsenal were defined based on a review of subsurface data collected during previous investigations and other physical observations (Weston, 2002).

1.3.4.2 According to Weston (2002), “A 300-foot wide, 25-foot-deep channel has historically been maintained by USACE from Raritan Bay upriver to immediately downstream of the former Arsenal.” A section of the river approximately adjacent to Area 6 and downstream of the former dock at Area 13 was dredged to maintain a turning basin, which vessels used for turning around in the channel after picking up supplies from the former Arsenal. The early (pre-1933) dredge channel continued upstream beyond and immediately adjacent to the former Arsenal, whereas more recent dredging activities (World War II era to 1993) were focused on maintaining a channel downstream of the turning basin toward Raritan Bay. Records indicate that the area adjacent to the former dock in Area 13 was dredged at least once in late 1944, but the channel in this area was likely maintained by dredging throughout the World War I and World War II eras (Weston, 2002). Additionally, in 1975, USACE increased the depth of the channel at this location by approximately 14 feet by dredging (Weston, 2002).

1.3.4.3 The records state that dredge spoils were disposed of within a portion of the facility referred to as Area G, which encompassed Area 14 as well as a portion of Area 6, Area 12, and the land area between Areas 6, 11, and 16 (Figure 1-1). In 1975, when USACE increased the depth of the Raritan River adjacent to Area 13, the dredge spoils were most likely placed within Areas 11, 12, 14, or an 8-acre parcel of land located within the northeast portion of DSA 5 (Figure 1-1) (Weston, 2002).

1.3.4.4 The primary source of munitions in the Raritan River is from items lost or dumped in the Raritan River near the Area 13 pier loading area (Dames & Moore, 1993b). In theory, items may have been spilled into the river and subsequently lodged within river sediments during the unloading and loading of cargo ships, or possibly as a result of cargo shifts (Figure 1-3). Additionally, the ASR (Dames & Moore, 1993b) indicates that an ammunition barge, the Frederick Star #9, sank at the Raritan pier on December 12, 1926 (Dames & Moore, 1993b). The barge carried “33,282 pounds of 75-millimeter (mm) shrapnel and 3,600 3-inch anti-aircraft projectiles” (Dames & Moore, 1993b). A recovery effort was performed, and on February 2, 1927, the Chief of Ordnance directed the Arsenal to inspect every box of ammunition retrieved from the sunken Frederick Star #9 to ensure that they had remained airtight.

1.3.4.5 On February 4, 1927, the Arsenal notified the Chief of Ordnance that the “salvage of 75-mm rounds from the sunken barge was half completed” and that “the recovered rounds were in good shape after being submerged for approximately 3 weeks. Most of the rounds retrieved were still packed in their boxes; however, at least 26 rounds were discovered to be loose” (Dames & Moore, 1993b). The ASR did not locate a final report that indicated whether all of the ammunition on the sunken Frederick Star #9 was recovered.

1.3.4.6 MEC within Areas 6, 6A, and DSA 1 and would most likely have been placed by the disposal of dredged material from the Raritan River potentially containing munitions items or by direct burial for disposal of munitions items.

1.4 Previous Investigations

1.4.1 Previous investigations conducted at Areas 6, 6A, and 6B are summarized in Table 1-3; details pertaining to the investigations are provided in Section 3, *Site Characterization*.

Physical Characteristics of the Study Area

2.0.1 This section presents the physical characteristics of Areas 6, 6A, and 6B, and discusses the land use, surface features, geology, hydrogeology, and ecology associated with this area. Although historical investigations were conducted primarily within Areas 6, 6A, and 6B, the physical characteristics described also apply generally to DSA 1.

2.1 Land Use

2.1.1 Areas 6, 6A, and 6B encompass a total of 130 acres in the eastern portion of the former Arsenal. Area 6 is predominantly undeveloped and is characterized by wetlands. The only development is the demolished remnants of the LaPlace, Inc. sulfuric acid manufacturing plant in Subarea 6A. Currently, this area is used as a parking lot, and the area may be suitable for future development.

2.2 Surface Features

2.2.1 The land surface across Areas 6, 6A, and 6B is predominately flat, but gently slopes to the southeast toward the Raritan River and locally toward the surface water drainages. Red Root Creek, which runs through Area 6, and Black Ditch, which runs between Subareas 6A and 6B, are the major drainage pathways in this portion of the former Arsenal. Red Root Creek and Black Ditch originate farther upstream, drain the surface runoff from Area 6, 6A, and 6B, and receive stormwater runoff from major portions of Raritan Center. Land surface elevations in Area 6, 6A, and 6B range from approximately +2 to +12 feet above mean sea level.

2.3 Geology

2.3.1 The geology beneath the former Arsenal is characterized by an overburden layer composed of unconsolidated sediments and underlain by bedrock consisting of shales, metamorphosed shales, and an igneous diabase sill. Weston created a geological conceptual site model (CSM) that subdivided the overburden and bedrock geology at the former Arsenal into six stratigraphic units: two bedrock units and four overburden units. From oldest to most recent, the units are identified as the Passaic Formation, the Palisades Sill, the Weathered Bedrock Group, the Lower Sand, the Meadowmat Formation, and the Upper Sand (Weston, 1996).

2.3.2 The unconsolidated overburden ranges from approximately 10 to 80 feet thick across the former Arsenal. The overburden is composed of an upper layer (the Upper Sand) comprising either general fill material, disposed dredge spoils, or reworked native soils, which are separated from the Lower Sand and bedrock units by a layer of the Meadowmat unit, composed of organic rich clay and silt with interbedded sands. The Upper Sand unit typically ranges from 2 to 10 feet thick, but can be up to 33 feet thick near the Raritan River (Weston, 1996).

2.3.3 Geologic cross-sections were completed for the Phase II RI (Roy F. Weston, 1997) and are shown on Figures 2-1 and 2-2. The Upper Sand unit is encountered across Area 6 and varies in thickness from less than 1 foot to as much as 10 feet. Soil borings indicate this unit consists of brown, gray, tan, and black, poorly graded sand, with varying percentages of silt and gravel. The fill appears to be reworked natural soil and/or deposited river dredge material associated with past cut and fill operations. Groundwater is encountered within the Upper Sand unit at Area 6, and at some locations before natural soil is encountered (Roy F. Weston, 1997).

2.3.4 At two locations the soil encountered at the surface was identified as the Meadowmat unit; however, it is sometimes difficult to distinguish the upper sand soil from dredge spoils and from the Meadowmat unit. For example, the Black Ditch Mounds, which are composed of dredge material placed along Black Ditch, were classified as Upper Sand.

2.3.5 The Meadowmat unit was observed at surface in two locations and ranged in thickness from 4.5 to 33.5 feet, thickening from northwest to southeast, toward the river. Soil borings indicate this unit consists of brown to dark gray sandy silt, with varying amounts of clay and organic material (Roy F. Weston, 1997).

2.3.6 The Lower Sand unit was observed in the borings for monitoring wells at Areas 6, 6A, and 6B. The lower sand unit consists of orange-brown to reddish-brown, tan, gray, and black well-graded (coarse to fine) sand with varying amounts of silt and gravel. Iron-staining and thin layers of interbedded silts and clays were also noted. The Lower Sand unit ranges in depth from approximately 7 to 58 feet below ground surface (bgs) across the former Arsenal, and has a maximum thickness greater than 39 feet (Roy F. Weston, 1997).

2.3.7 The Weathered Bedrock Group at Areas 6, 6A, and 6B was encountered at five monitoring well locations (MW-96 A/C, MW-97B, MW-98B, and MW-99B; see Figure 2-2). In this area of the former Arsenal, the unit consists of a very stiff, dark gray and white, fat clay and silt, with sand, becoming stiffer and more friable with depth. The unit occurs across the site at a depth of approximately 26 feet in the northwest. Thickness of the unit varies from 6.3 to 10.4 feet, and thins from northwest to southeast, toward the river (Roy F. Weston, 1997).

2.3.8 Competent bedrock of the Palisades Sill was encountered in the boring for well MW-96C (Figure 2-2) at a depth of 62.5 feet. The bedrock unit was described as a black to gray diabase with few natural fractures. Remnant fractures were evident based on secondary mineralization (pyrite, quartz, epidote) that has filled them (Roy F. Weston, 1997).

2.4 Hydrogeology and Water Use

2.4.1 The hydrogeology beneath the former Arsenal is characterized by overburden and bedrock aquifers. Groundwater within both the overburden and bedrock aquifers flows generally southeastward toward the Raritan River. The depth to shallow groundwater in the former Arsenal overburden ranges from 2 to 30 feet bgs, and the saturated portions of this unit are relatively thin and discontinuous (Weston, 1996). In the southern marsh areas such as Areas 6, 6A, and 6B, the shallow groundwater can be within 2 feet of the ground surface (Weston, 2008).

2.4.2 At Areas 6, 6A, and 6B, the direction of groundwater flow within the Lower Sand, where the majority of wells are screened, is southeast, consistent with sitewide observations. Depth to groundwater varies generally between 2 feet bgs and 4 feet bgs. Groundwater elevations measured for the Phase II RI ranged from -2.95 to +2.92 feet above mean sea level (Roy F. Weston, 1997). A groundwater contour map is provided on Figure 2-3.

2.4.3 Groundwater at Raritan Center is not used for drinking because it does not meet drinking water standards, primarily because of its natural salinity and iron, manganese, and sulfate concentrations. Public water supplies, provided by Middlesex Water Company through surface water and other groundwater supplies, are available for future development, and the water lines at the Raritan Center have been constructed in sizes to accommodate full development. Based on a review of water use information found in the New Jersey Department of Environmental Protection (NJDEP) Bureau of Water Allocation files for all wells within 2- and 5-mile radii of the facility, conversations with the Edison Health Department, and a supplemental field reconnaissance survey, there are no human receptors for the shallow groundwater at the former Arsenal. The Management Action Plan for the former Arsenal states

that, based on conversations with the Edison Health Department, an industrial laundry service is the sole user of bedrock groundwater at the former Arsenal (Weston, 2007).

2.5 Ecology

2.5.1 The majority of Area 6 is composed of estuarine emergent wetlands with a smaller portion of disturbed old field habitat. Subarea 6A is composed of almost all disturbed old field with a small area of estuarine emergent wetlands. Subarea 6B consists entirely of estuarine emergent wetlands (Figure 2-4). Based on the proximity of Areas 6, 6A, and 6B to the Raritan River, the tidal wetlands in this area are classified as estuarine emergent, even though they are seldom inundated by the tide because of the dikes along the river and tide gates that restrict and/or eliminate tidal flows. Areas 6, 6A, and 6B wetlands are dominated by common reed (*Phragmites australis*), with small stands of saltmarsh cordgrass (*Spartina alterniflora*).

2.5.2 Portions of Areas 6 and 6A consist of disturbed old field habitat. The old field habitats in the southern areas of the former Arsenal occur mostly where historical dredge material has been placed as fill and the areas now exhibit upland characteristics. These disturbed old field areas are dominated by grasses such as little bluestem (*Andropogon scoparius*), India grass (*Sorghastrum nutans*), and common reed (*Phragmites australis*), with some of the areas supporting woody vegetation, such as young gray birch (*Betula populifolia*) and staghorn sumac (*Rhus typhina*).

Site Characterization

3.0.1 This section presents the results of field investigations previously conducted at Areas 6, 6A, and 6B, including both the MEC investigations (Section 3.1) and investigations designed to delineate potential impacts related to MC and/or HTW (Section 3.2). The investigations completed through 2007 at Area 6, 6A, and 6B are listed in Table 1-3. Sample locations are shown on Figure 3-1. Section 3.3 provides an evaluation of the nature and extent of MC and HTW based on data obtained from historical investigations. The CSM is provided in Section 4, the current investigation is provided in Section 5, and the HHRA is provided in Section 6.

3.1 Munitions and Explosives of Concern

3.1.1 MEC investigations completed for Areas 6, 6A, and 6B between 1963 and 1993 are summarized in the following sections.

3.1.1 1963 LEAD Investigation

3.1.1.1 In 1963, Subareas 6A and 6B were identified by LEAD as one of 17 areas within the former Arsenal that were potentially contaminated by ordnance-related activities based on their use as burning grounds. These areas were disked to a depth of 6 inches bgs on three separate occasions, and then searched by LEAD personnel using hand rakes to clear the areas of ordnance material. The area (identified as Area 6) was recommended for unrestricted use. The GSA transferred this area in deed in 1965 to Federal Storage Warehouses with no restrictions (O'Brien & Gere Engineers, Inc. [O'Brien & Gere], 1989).

3.1.2 1989 O'Brien & Gere Contamination Evaluation

3.1.2.1 O'Brien & Gere conducted a site reconnaissance of Subareas 6A and 6B as part of a 1987/1988 contamination evaluation of the former Arsenal. A MEC survey (using a magnetometer) was conducted by UXB at the time, and it was reported that this survey did not detect any near-surface MEC (O'Brien and Gere, 1989).

3.1.3 1992 Phase I Remedial Investigation

3.1.3.1 A search for unexploded ordnance (UXO) in Subareas 6A and 6B performed prior to collection of subsurface samples for the Phase I RI, resulted in the discovery of minor components of inert ordnance. Three bomb vanes and several miscellaneous fragments were found on the south side of Subarea 6A. No other ordnance was detected (Dames & Moore, 1993b).

3.1.4 1993 Ordnance and Explosive Waste Location and Removal at the Former Raritan Arsenal

3.1.4.1 In 1993, 805 anomalies were identified during geophysical investigation of four 100-foot by 50-foot subareas (6A1, 6A2, 6B, and 6C; see Figure 3-1). Intrusive investigation of 200 anomalies (approximately 25 percent) identified only inert munitions components (bomb fins) (EOD Technology, Inc. [EOD], 1993).

3.1.5 1994 Phase II Remedial Investigation

3.1.5.1 During a Phase II RI that involved the installation of numerous monitoring wells and soil borings, neither UXO nor other MEC-related materials were encountered. One soil boring location was moved

because of the detection of a subsurface magnetic anomaly at 4 feet bgs, but it was not determined whether that anomaly was caused by buried metal waste, MEC, or naturally occurring elements (Roy F. Weston, 1997).

3.2 MC and HTW Investigations

3.2.1 This section provides a summary of the investigation history of MC and HTW in Areas 6, 6A, and 6B. There are no documented spills or known disposal-type releases of MC or HTW associated with DoD activities that occurred within Areas 6, 6A, 6B, and DSA 1. MC has the potential to have been released to the environment at Areas 6, 6A, and 6B due to the possible presence of MEC in the dredge spoils or due to DoD activities associated with the burning grounds. MC-related impacts from the MEC in dredge spoils are expected to be located within the dredge spoils due to the potential deterioration and breaching of MEC items over time. In this case, the MC-related impacts are expected to be directly associated with the MEC items. MC and/or HTW associated with historical burning activities are expected to be deposited on the surface, radiating outward close to the burn area.

3.2.2 Previous investigations at Areas 6, 6A, and 6B included the analysis of samples for a number of parameters including volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides/polychlorinated biphenyls (PCBs), metals, dioxins and furans, and explosives. The previous investigations were primarily driven by comparison to and exceedances of NJDEP criteria. Previous sample locations are shown on Figure 3-1. Sample dates and an evaluation of groundwater is not included as part of the RI and groundwater sampling events are not detailed in the following sections because groundwater is being addressed as a separate operable unit (OU) under a separate USACE contract. Detailed results of the Phase II RI and 2008 BERA sampling are provided in Section 6.2 as part of the HHRA discussion.

3.2.1 1989 O'Brien & Gere Contamination Evaluation

3.2.1.1 An initial evaluation of Subareas 6A and 6B was conducted in 1988, and included installation of three monitoring wells, and collection of three surface and nine subsurface soil samples and analysis for VOCs, metals, and explosives (O'Brien & Gere, 1989). VOCs and explosives were not detected in the surface or subsurface soil samples. Metals were detected in all soil samples, but at concentrations below action levels.

3.2.2 Phase I Remedial Investigation

3.2.2.1 In 1992, Dames & Moore completed field investigations for a Phase I RI, which included a soil gas survey, monitoring well installation, and soil and groundwater sampling.

3.2.2.2 Soil gas samples collected from Subarea 6A contained no detectable concentrations of VOCs. Several soil gas samples collected in Subarea 6B contained detectable concentrations of VOCs, and these locations were used to place monitoring wells for further evaluation.

3.2.2.3 Surface and subsurface soil samples were collected from 20 soil borings advanced in Subarea 6A and four soil borings advanced in Subarea 6B. Surface water and sediment samples were collected from three locations in Subarea 6A (Dames & Moore, 1993). Samples were analyzed for VOCs, SVOCs, metals, and explosives. Surface water and sediment samples were also analyzed for pesticides. Metals (arsenic, cadmium, and lead) detected in samples collected from multiple locations were the only constituents detected at elevated concentrations in soil samples. Arsenic, lead, mercury, and silver were also detected in surface water at concentrations exceeding EPA Marine Acute criteria. The explosive compounds nitroglycerin and pentaerythritol tetranitrate (PETN) were detected in one surface water sample, and one sediment sample contained the pesticide dichlorodiphenyl trichloroethane (DDT) at a concentration exceeding the screening criterion. No other VOCs, SVOCs, metals, explosives, or pesticides

were detected at concentrations exceeding screening criteria in surface water or sediment samples (Dames & Moore, 1993a).

3.2.3 Phase II Remedial Investigation

3.2.3.1 Data collected from more than 68 additional soil samples, 29 surface water, and 19 sediment samples were collected from Areas 6, 6A, and 6B in 1994 for the Phase II RI. Sample locations are shown on Figure 3-1. The samples were analyzed for various parameters, including VOCs, SVOCs, pesticides, PCBs, dioxins and furans, metals, and explosives. Concentrations of detected constituents (primarily metals and PAHs) were generally consistent across Areas 6, 6A, and 6B, and not suggestive of a DoD source area (Roy F. Weston, 1997).

3.2.4 Baseline Ecological Risk Assessment

3.2.4.1 A BERA field investigation was conducted to evaluate potential ecological exposure pathways present at the former Arsenal. Field activities were conducted from June through September 2005. Sample locations were selected to provide representative coverage of the habitats represented onsite, and were chosen largely based on historical site-specific chemistry data. The approach was not to sample every location, but rather to focus on selected areas indicative of a gradient of contamination so that inferences could be drawn regarding ecological risks (Weston, 2008).

3.2.4.2 The BERA investigation evaluated several risk-based hypotheses regarding the potential degree for ecological risks at the former Arsenal. Site-specific biological data were collected for several measurement endpoints to evaluate these hypotheses. The primary areas of concern investigated were freshwater habitats, estuarine habitats, and terrestrial habitats.

3.2.4.3 Ecological risks for aquatic habitats at the former Arsenal were characterized by investigating the surface water and sediment, the benthic macroinvertebrate community, and fish, frog, fiddler crab, and plant communities, as well as exposure pathways to higher-level avian and mammalian receptors. Ecological risks for terrestrial habitats were characterized by investigating the soil, soil invertebrate and small mammal communities, as well as exposure pathways to higher-level avian and mammalian receptors.

3.2.4.4 The results of these studies were collectively assessed in a weight-of-evidence approach to determine whether significant ecological risks were present at the former Arsenal compared to site reference areas. Approximately 95 percent of the land in Areas 6, 6A, and 6B is classified as wetlands, according to the U.S. Department of Interior, National Wetlands Inventory Map, dated October 29, 1976 (Roy F. Weston, 1997). The dominant habitat in Areas 6 and 6B is estuarine emergent wetland (*Phragmites*), with old field habitat occurring along the northeastern border of Area 6. Old field is the dominant habitat in Subarea 6A, with estuarine emergent wetland (*Phragmites*) occurring along the southwestern corner of this area. Areas 6, 6A, and 6B was evaluated as part of the Red Root Creek and Black Ditch drainage systems in the BERA (Weston, 2008b). The BERA concluded that, with few exceptions, there were no significant impacts to ecological receptors evaluated within estuarine environments located on the former Arsenal. Because conditions encountered during the recent RI investigation did not differ significantly from those identified during previous investigation work, no additional ecological evaluation is warranted.

3.3 Nature and Extent of MC and HTW

3.3.1 For this nature and extent evaluation, the historical data were compiled and compared to background concentrations where applicable (upper tolerance limit [UTL] with 95 percent coverage [95/95 UTL] for DSAs; see Appendix A), EPA RSLs (EPA, 2018), and NJDEP soil remediation standards (SRs). Background concentrations for the DSAs were only established for metals in soil and could be attributed to both native and anthropogenic sources. Organic constituents in soil could also be

background-related (i.e., from anthropogenic sources) and not necessarily site-related. Additionally, background concentrations were not established for surface water and sediment; however, constituents detected in these media could also be from background sources. As discussed in Sections 3.1 and 3.2, extensive characterization sampling was conducted in 1994 and 2005 and this information was evaluated for the nature and extent assessment of the media at Areas 6, 6A, and 6B. Surface water and sediment results were not compared to ecological criteria because this comparison had previously been completed in the BERA.

3.3.2 The Jenkins Method was used for field screening of data for the presence of trinitrotoluene (TNT). The Jenkins Method results are included for a conservative assessment in this nature and extent evaluation; however, the Jenkins Method consistently gave false positives as determined by comparison to samples analyzed using the fixed laboratory Method 8330¹.

3.3.3 The assessment for chlorinated dioxins and furans was performed using the toxic equivalency factor (TEF) methodology (EPA, 2010). The total amount of the dioxin and furan congeners is expressed as a toxic equivalent (TEQ) of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). Congener-specific data were available for 2,3,7,8-TCDD, 2,3,7,8-tetrachlorodibenzofuran, octachlorodibenzofuran, and octachlorodibenzo-p-dioxin.

3.3.1 Surface Soil

3.3.1.1 A summary of the samples and analyses for Areas 6, 6A, and 6B surface soil samples (samples collected from 0 to 2 feet) is shown in Table 3-1. The Areas 6, 6A, and 6B surface soil detections are summarized in Table 3-2. Historical analytical data for Areas 6, 6A, and 6B are presented in Appendix B. Fifty-five surface soil samples were collected from Areas 6, 6A, and 6B in 1994 and 2005. Sample analyses included VOCs, SVOCs, pesticides, PCBs, dioxins and furans, metals, explosives, total organic carbon (TOC), and pH. Results of the surface soil sample analyses are summarized as follows:

- **VOCs** – Thirty-nine samples were analyzed for VOCs. Of these, 10 samples had detections of VOCs; however, the concentrations did not exceed the EPA residential soil RSLs or NJDEP residential SRs for these constituents.
- **SVOCs** – Thirty-nine samples were analyzed for SVOCs, and 37 samples had detections of SVOCs. Sixteen samples contained benzo(a)pyrene at concentrations that exceeded EPA residential RSLs; however, none of the detected concentrations exceeded the NJDEP SRS. Samples with benzo(a)pyrene concentrations that exceeded RSLs are shown on Figure 3-3.
- **Pesticides/PCBs** – Thirty-nine samples were analyzed for pesticides and PCBs. Twenty sample locations had detections of pesticides. The detections of pesticides and PCBs did not exceed the EPA residential RSLs or NJDEP residential SRs.
- **Dioxins and Furans** – Four samples (06A01, 06A03, 06A04, and 06A08) were analyzed for dioxins and furans. All four samples had dioxin and furan detections that exceeded the 2,3,7,8-TCDD RSL. Sample locations are shown on Figure 3-1.
- **Metals** – Fifty-five samples were analyzed for metals, which were detected in all surface soil samples. Metals also occur naturally in background soils. Ten metals (aluminum, antimony, arsenic, cadmium, cobalt, iron, manganese, mercury, thallium, and vanadium) were detected in at least one soil sample at concentrations exceeding EPA residential RSLs. Arsenic and vanadium were detected in at least one soil sample at concentrations exceeding NJDEP residential SRs. Arsenic was detected in all 55 soil samples at concentrations exceeding the EPA residential RSL, and in 37 soil samples at

¹ The Jenkins Method is an explosives colorimetric field screening method that is subject to bias from chemically similar compounds or matrix interference. The interpretation of TNT concentration using this method is specifically affected by the amount of humic material in the soil sample (Jenkins and Walsh, 1992).

concentrations exceeding the NJDEP SRS of 19 milligrams per kilogram (mg/kg). Arsenic exceedances of the NJDEP SRS are shown on Figure 3-2.

- **Explosives** – Fifty-two samples were screened for explosives using the Jenkins Method. Twenty-one of these samples were positive for TNT. Eight of the samples with the highest detections were analyzed for explosives by Method 8330. None of these samples had explosives detections.

3.3.2 Subsurface Soil

3.3.2.1 A summary of the samples and analyses of the Areas 6, 6A, and 6B subsurface soil samples (samples collected below 2 feet) is shown in Table 3-3. A summary of Areas 6, 6A, and 6B subsurface soil detections is presented in Table 3-4. Historical analytical data for Areas 6, 6A, and 6B are presented in Appendix B. Eleven subsurface soil samples were collected from Areas 6, 6A, and 6B in 1994 and 2005. Because water was typically encountered at approximately 2 feet, limited vadose subsurface soil samples could be collected within areas outside of Subarea 6B. Sample analyses included VOCs, SVOCs, pesticides, PCBs, metals, explosives, TOC, and pH. Results for analyses of subsurface soil samples are summarized as follows:

- **VOCs** – Eleven samples were analyzed for VOCs and four samples had VOC detections. However, the concentrations did not exceed the residential soil RSLs or NJDEP SRS values.
- **SVOCs** – Eleven samples were analyzed for SVOCs, and 10 samples had detections. Seven samples contained benzo(a)pyrene at concentrations that exceeded EPA residential RSLs; however, none of the detected concentrations exceeded the NJDEP SRS. Samples with benzo(a)pyrene concentrations that exceeded RSLs are shown on Figure 3-5.
- **Pesticides/PCBs** – Eleven samples were analyzed for pesticides and PCBs. Nine samples had detections of pesticides. PCBs were not detected. Heptachlor epoxide was detected in sample 06B06A at a concentration exceeding the EPA residential soil RSL and NJDEP residential SRS. Sample locations are shown on Figure 3-1.
- **Dioxins and Furans** – Three samples (06B01AZ, 06B06A, and 06B06Z) were analyzed for dioxins and furans. All three samples had dioxin and furan detections that exceeded the 2,3,7,8-TCDD RSL. Sample locations are shown on Figure 3-1.
- **Metals** – Eleven samples were analyzed for metals, which were detected in all subsurface soil samples. Five metals (antimony, arsenic, cobalt, iron, and vanadium) were detected in one or more samples at concentrations exceeding EPA residential RSLs and/or NJDEP residential SRSs. Arsenic was detected in all subsurface soil samples at concentrations exceeding the EPA residential RSL, and in three subsurface soil samples at concentrations exceeding the NJDEP SRS of 19 mg/kg. Arsenic exceedances of the NJDEP SRS are shown on Figure 3-4.
- **Explosives** – Eleven samples were screened for explosives using the Jenkins Method. Only sample 06B02AZ was positive for TNT. Two samples (06B02A and 06B02AZ) were analyzed for explosives by Method 8330. None of these samples had explosives detections.

3.3.3 Surface Water

3.3.3.1 A summary of the samples and analyses of the Areas 6, 6A, and 6B surface water samples is shown in Table 3-5. Areas 6, 6A, and 6B surface water detections are presented in Table 3-6. Historical analytical data for Areas 6, 6A, and 6B are presented in Appendix B. Twenty-nine surface water samples were collected from Areas 6, 6A, and 6B in 1994 and 2005. Surface water sample analyses included VOCs, SVOCs, pesticides, PCBs, dioxins and furans, metals, and explosives. Results for analyses of surface water samples are summarized as follows:

- **VOCs** – Twenty-five samples were analyzed for VOCs. VOCs were detected in 12 samples. TCE exceeded the EPA tap water RSL in six of the samples (SW-0616H/L, SW-0617H/L, SW-0618L, and SW-0619L). Sample locations (all along Black Ditch) are shown on Figure 3-1.
- **SVOCs** – Twenty-five samples were analyzed for SVOCs. SVOCs were detected in nine samples. Bis(2-ethylhexyl)phthalate was detected in one surface water sample (SW-0614) at a concentration exceeding the EPA tap water RSL. Sample locations are shown on Figure 3-1.
- **Pesticides/PCBs** – Twenty-five samples were analyzed for pesticides and PCBs. Pesticides and PCBs were not detected in any of the samples.
- **Dioxins and Furans** – Eight samples were analyzed for dioxins and furans. Dioxins and furans were not detected in any of the surface water samples.
- **Metals** – Twenty-nine samples were analyzed for total metals. Metals were detected in all surface water samples. Sixteen metals (aluminum, antimony, arsenic, beryllium, cadmium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, thallium, vanadium, and zinc) exceeded the EPA tap water RSLs in at least one sample.
- **Explosives** – Twenty-nine samples were analyzed for explosives by Method 8330. Explosives were detected in five surface water samples (SW-0616H/L, SW-0617H/L, and SW-0618L). Sample locations (all along Black Ditch) are shown on Figure 3-1. None of the detections exceeded the EPA tap water RSLs.

3.3.4 Sediment

3.3.4.1 A summary of the samples and analyses of the Areas 6, 6A, and 6B sediment samples is shown in Table 3-7. Areas 6, 6A, and 6B sediment detections are summarized in Table 3-8. Historical analytical data for Areas 6, 6A, and 6B are presented in Appendix B. Twenty-eight sediment samples were collected from Areas 6, 6A, and 6B in 1994 and 2005. Sediment sample analyses included VOCs, SVOCs, pesticides, PCBs, dioxins and furans, metals, explosives, TOC, and pH. Results for analyses of sediment samples are summarized as follows:

- **VOCs** – Seventeen samples were analyzed for VOCs. At least one of seven VOCs (2-butanone, 2-hexanone, 4-methyl-2-pentanone, acetone, carbon disulfide, toluene, and trichloroethene) was detected in all of the samples. None of these detections exceeded the EPA residential RSLs or NJDEP residential SRSSs.
- **SVOCs** – Twenty-seven samples were analyzed for SVOCs. At least one SVOC was detected in 24 of the samples. Twenty-one sediment samples contained at least one of four SVOCs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, and/or dibenzo(a,h)anthracene) at concentrations exceeding the EPA residential RSLs and/or NJDEP residential SRSSs. Sample locations are shown on Figure 3-1.
- **Pesticides/PCBs** – Twenty-seven samples were analyzed for pesticides, and twenty samples had pesticide/PCB detections. Aroclor-1260 was detected in three samples (SD-0604L, SD0634, and SD0635) at concentrations exceeding the EPA soil residential RSL and NJDEP SRS. These detections were each along the Red Root Creek and adjacent to paved road. One pesticide (4,4-DDD) was detected in one sample (SW0627) at a concentration greater than the EPA soil residential RSL but less than the NJDEP soil SRS.
- **Dioxins and Furans** – Five samples were analyzed for dioxins and furans. Dioxins and furans were detected in all five samples. Dioxin concentrations in all five samples (SD-0609L, SD-0613, SD-0615, SD-0616L, and SD-0619L) exceeded the 2,3,7,8-TCDD RSL.
- **Metals** – Twenty-six samples were analyzed for metals, which were detected in all sediment samples. Concentrations of 11 metals (aluminum, antimony, arsenic, cadmium, cobalt, iron,

manganese, mercury, nickel, thallium, and vanadium) in one or more samples exceeded the EPA residential soil RSLs and/or NJDEP residential soil SRSs.

- **Explosives** – Seventeen samples were analyzed for TNT using the Jenkins Method. Eight of the samples had detections of TNT. However, five confirmatory samples for explosives using Method 8330 were collected, and explosive compounds were not detected in any of the samples. This suggests that the Jenkins Method provided false positive results. Explosives are considered not present in the sediments from Areas 6, 6A, and 6B.

3.4 Fate and Transport

3.4.1 The detected constituents were evaluated for their potential to migrate across media, specifically soil to groundwater, at Areas 6, 6A, and 6B. A quantitative screening comparison was conducted by comparing detected concentrations against the EPA risk-based soil screening levels (SSLs) for protection of groundwater, with a default dilution attenuation factor (DAF) of 10 to account for dilution that occurs as a chemical in precipitation mixes with the groundwater (EPA, 2018). An exceedance was identified when the area mean concentration exceeded the corresponding SSL and mean background concentration, if available. Surface soil was included in the screening for the soil-to-groundwater migration pathway due to the presence of shallow groundwater at Areas 6, 6A, and 6B. As discussed below, no significant leachability potential is identified for soils at Areas 6, 6A, and 6B.

3.4.1 Contaminant Sources and Release Mechanisms

3.4.1.1 The primary source of potential contamination at Areas 6, 6A, and 6B is DoD activities associated with the burning grounds, and munitions items contained in material dredged from the Raritan River and placed in DSA 1. MC-related impacts from the MEC in dredge spoils are expected to be located within the dredge spoils due to the potential deterioration and breaching of MEC items over time. In this case, the MC-related impacts are expected to be directly associated with the MEC items. MC and/or HTW associated with historical burning activities are expected to be deposited on the surface, radiating outward close to the burn area (Subareas 6A and 6B). It is likely that impacts associated with burning of ordnance would primarily affect surface soil because the burning was reportedly conducted on the ground surface.

3.4.1.2 Tables 3-9 and 3-10 show the detected constituent concentrations in surface and subsurface soil, respectively, compared to DSA background values (if available) and the SSL values to evaluate the soil-to-groundwater leachability pathway. Surface and subsurface soil constituents with exceedances above the SSLs, including MC and HTW constituents detected at Areas 6, 6A, and 6B, are further discussed to present a rationale as to whether these can serve as a future source of groundwater contamination.

3.4.2 Potential Routes of Migration

3.4.2.1 The primary pathways for contaminant transport from Areas 6, 6A, and 6B are erosion or leaching from soil and migration to surface water (Black Ditch and Red Root Creek) by surface water runoff or infiltrating, percolating, and leaching of constituents to groundwater. Groundwater at the former Arsenal is being evaluated as a separate OU and is being addressed under a separate USACE contract.

3.4.2.2 Evaluation of contaminants in Black Ditch and Red Root Creek sediment and surface water indicate that contaminants are either not derivative of contaminants in soil at Areas 6, 6A, and 6B (Aroclor-1260 in sediment and trichloroethene in surface water), or are pervasive in soil, surface water, and sediment across the site and not suggestive of a source area (PAHs, dioxins and furans, metals).

3.4.3 Contaminant Persistence and Leachability

3.4.3.1 VOCs, SVOCs, pesticides, metals, and one explosive (i.e., 2,4,6-TNT based on the Jenkins Method) were detected above their respective SSLs in soil at Areas 6, 6A, and 6B.

3.4.3.1 VOCs

3.4.3.1.1 Methylene chloride was the only VOC detected in surface soil at concentrations exceeding the SSL. VOCs were not detected in subsurface soil at concentrations greater than their respective SSLs. Methylene chloride was detected in five of 39 surface soil samples at concentrations ranging from 0.017 mg/kg to 0.1 mg/kg, compared to the SSL of 0.013 mg/kg. The maximum detected concentration (0.1 mg/kg) was from sample location 0614 at a depth of 0 to 0.5-feet bgs. Methylene chloride was not detected in the deeper sample (0.5 to 2 feet bgs) collected from this location. Additionally, the detections of methylene chloride were from samples collected only in 1994; therefore, it is likely that the concentrations have volatilized over time. Due to the relatively low detection frequency, lack of subsurface soil detections, and age of the analytical data, it is unlikely the methylene chloride detections in surface soil are a significant source of leaching to groundwater at Areas 6, 6A, and 6B.

3.4.3.2 SVOCs

3.4.3.2.1 Benzo(a)anthracene in surface and subsurface soil and naphthalene in surface soil were the only detected SVOCs with detected site concentrations exceeding their respective SSLs. No background values were available for comparison. Although SVOCs may be persistent in soil, they typically have low solubility. The PAHs could be from non-point anthropogenic sources or the dredge material in DSA 1, which could have been previously contaminated by HTW derived from offsite sources. Concentrations of detected PAHs were generally consistent across Areas 6, 6A, and 6B, and not suggestive of a DoD source area.

3.4.3.3 Pesticides

3.4.3.3.1 Four pesticides (4,4-dichlorodiphenyl dichloroethane [DDD], 4,4-dichlorodiphenyl dichloroethylene [DDE], 4,4-DDT, and aldrin) in surface soil and three pesticides (4,4-DDD, aldrin, and heptachlor epoxide) in subsurface soil were detected at concentrations greater than their respective SSLs. With the exception of aldrin, the site mean concentrations for these pesticides were less than the SSLs. Aldrin exceeded the SSL in one surface soil sample and two subsurface soil samples. Aldrin adsorbs strongly to soil and is only slightly soluble in water; therefore, aldrin is not likely to be a significant source of leaching to groundwater. Additionally, the pesticides detected in soil are not associated with a site-specific release and were likely applied as part of routine maintenance activities.

3.4.3.4 Metals

3.4.3.4.1 Eleven metals (antimony, arsenic, barium, cadmium, cobalt, iron, lead, manganese, mercury, selenium, and thallium) were detected in surface soil at concentrations exceeding the SSLs; however, only arsenic was detected in surface soil with a mean concentration exceeding the background mean concentration. Arsenic was not detected in any of the subsurface soil samples at concentrations greater than the DSA background value. Five metals (antimony, arsenic, cobalt, iron, and selenium) were detected above SSLs in the subsurface soil samples; however, only antimony (in two samples) was detected at concentrations exceeding the DSA background value. The metals detected in surface and subsurface soil are naturally occurring and were detected in the DSA background samples; their reported presence does not indicate a contaminant release. The mobility of metals is complex and depends on several factors such as the overall groundwater composition, pH, metal complex formation, valence state of the metal, and cation exchange capacity.

3.4.3.5 Explosives

3.4.3.5.1 One explosive (2,4,6-TNT based on the Jenkins Method) was detected in surface and subsurface soil at concentrations greater than the SSL. The concentrations of 2,4,6-TNT, based on the Jenkins Method, ranged from 1.2 mg/kg to 37 mg/kg in surface soil, compared to the SSL of 0.15 mg/kg. 2,4,6-TNT was only detected in one subsurface soil sample at a concentration of 6.1 mg/kg. The analytical results based on the Jenkins method are not reliable due to the false positives, as determined by comparison to samples analyzed using the fixed laboratory Method 8330. There were no detections of 2,4,6-TNT in surface or subsurface soil based on the fixed laboratory Method 8330; therefore, 2,4,6-TNT is not identified as a source of leaching to groundwater.

3.4.4 Contaminant Migration

3.4.4.1 Based on the previous investigations and the historical data, there is minimal potential for MC or HTW presence or exposure in site media. Surface runoff and soil vertical migration through leaching are not potential migration pathways for contamination based on comparison of surface and subsurface soil, surface water, and sediment concentrations to SSLs and/or background values.

3.5 Site-to-Background Statistical Comparison

3.5.1 Tests of central tendency were performed to determine with statistical confidence, whether metals concentrations at Areas 6, 6A, and 6B DSA 1 are different, on average, from background concentrations. The appropriate type of central tendency comparison test is determined based on the statistical distribution of the two data sets. For cases where both data sets appear to be normally distributed, a t-test can be run on the raw data to determine whether the means of the two populations appear to be different from one another. The specific form of t-test (Student's t-test or Welch's t-test) is determined based upon whether the variances of the data sets can be considered equal. If the distributions of the data sets do not coincide or if they all are nonparametric, then the nonparametric Wilcoxon Rank Sum (WRS) test typically is used for comparison of central tendency. This is a nonparametric version of a two-sample t-test and calculates whether the medians of the two distributions are different or similar. For data sets that contain censored (non-detect) results, the Tarone-Ware two-sample test is utilized instead of the WRS test. The Tarone-Ware test is specifically designed to accommodate censored data sets with multiple reporting limits (EPA, 2009).

3.5.2 A two-sample randomization (permutation) test for location based on the population means also was performed. A randomization test works by simply enumerating all possible outcomes under the null hypothesis, then seeing where the observed outcome fits in (Conover, 1999; Manly, 2007). A randomization test is also called a permutation test, because it involves permuting the observations during the enumeration procedure. For a one-sided upper alternative test, the calculated probability (commonly referred to as the p-value) is computed as the proportion of times that the differences of the means (or medians) in the permutation distribution are greater than or equal to the observed difference in means (or medians).

3.5.3 The comparisons were performed using a common null hypothesis that concentrations of each metal in the on-site sample population is less than or equal to background concentration levels. The tests were conducted using a significance level of 0.05 (corresponding to a 95 percent confidence level). If the calculated probability (p-value) from a test is below 0.05, a conclusion is drawn to reject the null hypothesis and instead determine that a significant test result exists. In these tests, a p-value is calculated which is essentially the probability that the observed differences between the centers of the two sample sets occurred merely due to random variability in the data, or whether those differences are an indication that the center of the site population is greater than background.

3.5.4 Table 3-11 presents the results of the central tendency tests conducted using the surface and subsurface soil data (0-10 feet bgs) collected from Areas 6, 6A, and 6B and DSA 1 and the surface and

subsurface soil data (0-10 feet bgs) collected from the background reference areas (refer to Appendix A). Only metals exceeding their respective BTVs were included in the statistical tests. Additionally, statistical testing was not performed on those metals that contained greater than 50 percent censored (non-detect) results. Table 3-11 also includes the results of the Shapiro-Wilk test for normality and the F-test for equal variance. The raw data were transformed using common logarithms when the transformed data improved unequal variances in the data sets. The transformation improved unequal variances for barium; therefore, the statistical tests were run on the transformed data for barium. The results of the statistical testing indicate that concentrations of barium and lead at Areas 6, 6A, and 6B and DSA 1 are statistically greater than those observed in background.

Conceptual Site Model

4.0.1 The CSM relates potentially exposed receptor populations to potential source areas based on physical site characteristics and complete exposure pathways. Important components of the CSM are the identification of potential source areas, methods of interaction (i.e., transport pathways, access, exposure media, exposure pathways, and routes), and receptor groups. Actual or potential exposure of receptors associated with a site are determined by identifying the most likely, and most important, pathways of release, transport, and interaction. A complete exposure pathway has three components: (1) a source that results in a release to the environment; (2) a method of interaction or pathway of transport through an environmental medium; and (3) a receptor. The main objective of the CSM is to identify any complete and critical exposure pathways that may be present.

4.0.2 The preceding sections have presented the physical setting, site history, and land use (past, present, and projected). Results of previous investigations are summarized in Section 3. Based on this information, the following sections discuss potential source areas, transport pathways, and exposure pathways. The baseline CSM described in the RI/FS Work Plan formed the basis for the RI fieldwork and the information obtained during this RI has been used to update and refine the CSM.

4.1 Potential Source Areas

4.1.1 MEC within Areas 6, 6A, 6B and DSA 1 would most likely have been placed by the disposal of dredged material from the Raritan River or through release from the burning grounds. Because wetland or open water areas would have been difficult to access, it is assumed that these areas were filled with dredge spoils before being used as burning grounds. MEC in the DSA is found both randomly distributed throughout the land area at various depths within the subsurface and clustered within the subsurface. MEC released from the burning grounds would most likely be scattered on the ground surface and shallow subsurface in close proximity to the burning areas. DSA 1 and the burning grounds areas (Subareas 6A and 6B) boundaries are shown on Figures 1-1 and 1-2.

4.1.2 MC has the potential to have been released to the environment at Areas 6, 6A, and 6B due to the potential presence of MEC in the dredge spoils or due to DoD activities associated with the burning grounds. MC-related impacts from the MEC in dredge spoils are expected to be located within the dredge spoils due to the potential deterioration and breaching of MEC items over time. In this case, the MC-related impacts are expected to be directly associated with the MEC items. MC and/or HTW associated with historical burning activities are expected to deposit on the surface, radiating outward close to the burn area. No MEC items have been identified at Areas 6, 6A, and 6B, and explosives were not detected at elevated concentrations in soil, surface water, and sediment samples. However, the majority of Subarea 6 and all of Subarea 6A are underlain by dredge spoils from the Raritan River, which could have been previously contaminated by HTW derived from offsite sources upstream or downstream (due to tidal effects) of the former Arsenal.

4.2 Transport Pathways

4.2.1 A transport pathway describes the mechanisms by which site-related constituents, once released, may be transported from a source area to environmental media (such as surface soil) where receptor exposures may occur. The primary mechanisms for potential transport of constituents from the potential source areas are listed below:

- Dust emanating from surface or subsurface soil to ambient air from wind or during maintenance activities at the site or from areas lacking vegetative cover

- Direct contact with soil containing constituents of potential concern (COPCs) (receptor contact with onsite surface or subsurface soil replaces release and transport)
- Direct contact with surface water and sediment containing COPCs
- Surface runoff from source areas into drainages and streams, eventually discharging to the Raritan River
- Infiltrating, percolating, and leaching contaminants from source areas

4.2.2 The potential release and transport pathways for Areas 6, 6A, 6B and DSA 1 are depicted on Figure 4-1.

4.3 Exposure Pathways

4.3.1 An exposure pathway describes the mechanisms whereby receptors come into contact with site-related constituents or hazards. Exposure, and therefore potential risk, can only occur if complete exposure pathways exist.

4.3.1 MEC

4.3.1.1 An MEC exposure pathway requires both access and interaction. The receptor must not only have access to an area that contains MEC, but the receptor's activities must be such that there is interaction with the MEC item. Potential human receptors at Areas 6, 6A, 6B and DSA 1 include maintenance workers, recreational users, industrial commercial/utility workers, and hypothetical future residents. Surface and subsurface MEC has not been documented in at Areas 6, 6A, 6B and DSA 1, but may be present in previously uninvestigated areas and may present an explosive risk to these potential receptors (Figure 4-1). Further evaluation of MEC across Area 6 and DSA 1 is provided in Section 5, MEC Evaluation.

4.3.2 MC and HTW

4.3.2.1 A potential MC exposure risk requires a complete exposure pathway from source to receptor. Constituents detected in site media during previous site investigations may pose a risk to receptors as shown on Figure 4-2. Potential impacts/risks from site media constituents on human health and ecology are discussed further in Section 6, Human Health Risk Assessment.

4.3.3 Human Health Exposures Pathway Potential

4.3.3.1 Areas 6, 6A, 6B and DSA 1 is mostly undeveloped wetland that is owned by FBC. The only development is the demolished remnants of the LaPlace, Inc. sulfuric acid manufacturing plant in Area 6A, which is currently a shipping facility parking lot. Occasional maintenance workers could potentially be exposed to MEC, MC, or HTW in this area. Areas 6, 6A, and 6B is located adjacent to the river and may be suitable for future development. If the areas are developed as an industrial facility, then future industrial and construction/utility workers may be exposed to surface soil, total soil (0 feet bgs to the depth of the water table) and/or emissions from total soil (Figure 4-2). The wetland areas adjacent to the river may also be accessible to offsite public visitors, so a recreational visitor/trespasser scenario is also potential future exposure pathway. Although future residential use is not likely for these areas, this scenario was evaluated for risk management purposes.

4.3.3.2 Additional details of the exposure scenarios and receptors are discussed in Section 6. Potential exposures to groundwater were not evaluated in this RI because groundwater/indoor air (vapor intrusion) at the former Arsenal is being evaluated as a separate OU and is being addressed under a separate USACE contract. The potentially complete exposure pathways identified for soil, surface water, and sediment were quantitatively evaluated in the HHRA and are discussed in Section 6.

4.3.4 Ecological Exposures Pathway Potential

4.3.4.1 The majority of Areas 6, 6A, 6B and DSA 1 consists of estuarine emergent wetlands with a smaller portion of disturbed old field habitat (Figure 2-4). Areas 6, 6A, and 6B wetlands are dominated by common reed (*Phragmites australis*), with small stands of saltmarsh cordgrass (*Spartina alterniflora*). The disturbed old field areas are dominated by grasses such as little bluestem (*Andropogon scoparius*), India grass (*Sorghastrum nutans*), and common reed (*Phragmites australis*), with some of the areas supporting woody vegetation, such as young gray birch (*Betula populifolia*) and staghorn sumac (*Rhus typhina*). The areas provide habitat for a variety of potential ecological receptors including white-footed mouse (*Peromyscus leucopus*), short-tail shrew (*Blarina brevicauda*), and white-tailed deer (*Odocoileus virginianus*), red foxes (*Vulpes fulva*), and possibly Norway rats (*Rattus norvegicus*).

4.3.4.2 Ecological receptors could be exposed to chemicals via several routes. Lower-trophic-level species (plants, benthic macroinvertebrates) are likely to have their greatest exposure through direct contact with contaminated media. Wildlife, meanwhile, may be exposed to chemicals via a broader range of routes, including the ingestion of chemicals from soil, sediment, surface water, or food while foraging, and the dermal absorption of chemicals from soil, sediment, or surface water via direct contact. For chemicals having the potential to bioaccumulate, the greatest exposure to wildlife is likely to be from the ingestion of prey. For chemicals having a limited potential to bioaccumulate, the exposure of wildlife to chemicals is likely to be greatest through the direct ingestion of the contaminated media, such as soil. Potentially complete exposure pathways identified for soil, sediment, and surface water were quantitatively evaluated in the facility-wide BERA (Weston, 2008), while the potential for site-related risk to ecological receptors from the presence of MC is discussed in Section 7, *Ecological Risk Assessment*.

MEC Investigation Results

5.0.1 Intermittently from October 2013 to May 2014, CH2M conducted field investigation activities at Areas 6, 6A, 6B and DSA 1 in accordance with the Final RI/FS Work Plan (CH2M, 2016). Appendix C contains photographs of the Areas 6, 6A, 6B and DSA 1 investigation activities. The progress and findings of the field investigation activities were communicated and discussed with USACE representatives on a daily basis via daily summary reports and weekly production and quality control (QC) conference calls.

5.0.2 MEC evaluation completed for this RI included digital geophysical mapping (DGM) survey to identify anomalies associated with dredge spoils within Subareas 6, 6A, and DSA 1. Because no focused MEC investigations were previously performed in Area 6, and because the potential presence and distribution of MEC within the dredge spoils was not fully characterized, additional investigation was required to define the nature and extent of MEC potentially associated with DSA 1, which includes Subareas 6 and 6A. DGM transects were conducted along 3-meter-wide transects spaced at 80-meter intervals within DSA 1. In addition, a series of 1-meter-wide transects spaced at 3-meter intervals was placed across an area of potential pit locations identified between Areas 6 and 6A in a 1963 aerial photograph. As described in the approved Work Plan, Area 6B is not known to be underlain by dredge deposits, so Area 6B was not included in the RI DGM. A geostatistical analysis was performed on the anomalies detected to map anomaly densities and identify any clustering of metallic items (Figure 5-1).

5.0.3 Fieldwork to complete the MEC investigation at Areas 6, 6A, 6B and DSA 1 was conducted in accordance with the overall three-phase investigation approach for the project described in the Final RI/FS Work Plan (CH2M, 2016):

- **Phase 1** – DGM, processing and interpreting of data; selection of anomalies for intrusive investigation.
- **Phase 2** – Intrusive investigation of select anomalies to characterize the nature of the anomaly sources and evaluate potential MC release to the environment through breaching or degradation.
- **Phase 3** – Media sampling for MC evaluation to investigate the nature and extent of potential releases that may be associated with MEC finds identified as being breached or degraded. MEC was not found in Subareas 6 and 6A or DSA 1; therefore, no additional sampling was warranted. However, soil samples were collected from DSA 1 in August 2016 to include in the DSA background study (Appendix A).

5.0.4 During the MEC investigation, the field management team consisted of a Site Manager/Senior UXO Supervisor (SUXOS), a UXO Safety Officer/UXO QC Specialist, and a Site Safety and Health Officer. Other team members included UXO Technicians, a Senior Geophysicist, a Senior Chemist, and Senior Project Geologists. CH2M was supported by the following subcontractors in conducting the fieldwork:

- **USAE** – Site preparation, vegetation reduction, intrusive investigation
- **VARGO Associates** – Professional land surveying
- **NAEVA** – DGM surveying and data processing

5.0.5 The objective of the DGM was to characterize the extent of geophysical anomalies that may be indicative of MEC and/or material potentially presenting an explosive hazard (MPPEH) within the area shown on Figure 5-1. The geophysical investigation reports for Subareas 6 and 6A and DSA 1 are provided in Appendix D and IVS Report is provided in Appendix E. Daily reports are provided in Appendix F.

5.1 MEC Characterization

5.1.1 This section provides a description of the investigative methods used at Subareas 6 and 6A and DSA 1, including the DGM and associated data interpretation, anomaly reacquisition, and intrusive investigation. DGM and associated QC was performed by NAEVA with additional QC performed by CH2M's Munitions Response QC Geophysicists. Two phases of DGM were performed for Subareas 6 and 6A and DSA 1 because intrinsic noise in the towed array system identified in the initial data collected in December 2013 affected the selection of anomalies within the low amplitude range. These areas were resurveyed in February 2014. The sequence of DGM investigation and data interpretation at Subareas 6 and 6A and DSA 1, along with a root cause analysis for the resurvey, is further explained in Appendix G. The timeframes for investigation in Subareas 6 and 6A and DSA 1 are provided in Table 5-1.

5.1.1 DGM Instrumentation

5.1.1.1 The Geonics EM61-MK2 was used exclusively for the DGM work completed at DSA 1. The EM61-MK2 is a high-resolution time-domain electromagnetic instrument designed to detect, with high spatial resolution, shallow ferrous and nonferrous metallic objects. The EM61-MK2's transmitter generates a pulsed primary magnetic field, which then induces eddy currents in nearby metallic objects. For this project, the EM61-MK2 was used to measure eddy currents at four distinct time intervals. Measurement using earlier time gates provided enhanced detection of smaller metallic objects. Real-time kinematic global positioning system (RTK-GPS) for data positioning was used to attain a final target resolution of approximately 50 centimeters after correction for other potential intrinsic positioning errors.

5.1.1.2 DGM survey across the majority of the DSA 1 was conducted using a vehicular towed array system consisting of three EM61-MK2 time domain electromagnetic induction detector coils mounted side-by-side and towed behind an ARGO utility task vehicle along 3-meter-wide transects nominally spaced at 80-meter intervals. DGM in the potential pit area was conducted using a single person-portable EM61-MK2 along transects nominally spaced at 3-meter intervals. Positioning was accomplished using RTK GPS. The eastern end of Transect 3 was shifted to the south to avoid collecting DGM data over railroad tracks. Data could not be collected over approximately 100 meters near the eastern end of Transect 6 due to a large berm that did not allow the safe passage of the DGM system or over a 15-meter section in the center of Transect 6 where a canal crossed the survey path (Appendix G).

5.1.2 DGM Data Quality Objectives

5.1.2.1 The statistical sampling design for the DSAs is based on a multi-stage sampling technique with utilization of both systematic sampling and simple random sampling methods at various stages of the investigation. The investigation approach was developed with involvement of USACE and NJDEP during a meeting held on September 5, 2013. A presentation from that meeting is provided in Appendix D. In summary, a systematic random sampling method was used to divide each site into transects to achieve 95% confidence that at least 95% of the remainder of each site has no discarded military munitions (DMM). At this stage each individual DSA was subdivided in a similar fashion and Visual Sampling Plan (VSP) was used to determine the quantity of transects that were needed to be surveyed in each area to achieve the desired confidence level. Transects were then distributed across each area to exceed the total transect length calculated by VSP with each area oversampled by at least 25% to increase confidence in the results. Slide 7 of the meeting presentation included in Appendix D summarizes the results (calculated and proposed transect lengths) from the first stage of the statistical sampling design.

5.1.2.2 In DSA 1 the calculated aerial coverage required to achieve 95% confidence was 2 acres and the planned survey design was for 2.67 acres to be covered by DGM transects. Utilizing a 3-meter-wide towed array the total design transect length was calculated to be 11,611 feet. The actual survey transect length of 16,069 feet exceeded the design transect length and equates to an aerial coverage of 3.69

acres. The initial DGM survey identified the overall anomaly density as low across the site, with the exception of developed areas where the elevated anomaly density was likely related to the presence of a parking lot, railroad tracks, and underground utilities (see Appendix G). No specific areas of anomaly clustering that warranted placement of additional, more closely spaced transects were identified.

5.1.2.3 The DGM survey of the transects then established units for the 2nd stage of the statistical sampling. The second stage of sampling utilized simple random sampling (using the Estimating a Proportion method as explained in Section 5.1.4) to select the anomalies for intrusive investigation to achieve 95% confidence in the nature of the anomaly sources within the surveyed population. As the second stage was designed specifically to investigate with 95% confidence the nature of the anomaly sources within the population or within the transects, it does not represent the entire population within the DSA. Therefore, historical data gathered from site documents as described in Sections 3.1 and 3.2 were used to assess the remainder of the site. In the historical record where a potential pit area was identified, DGM was conducted using a single person-portable EM61-MK2 along transects nominally spaced at 3-meter intervals.

5.1.2.4 Data quality objectives (DQOs), measurement performance criteria, and the test methods specific to the DGM surveys are summarized in Table 5-2. A QC program was applied to the DGM operations to ensure all DQOs specific to the DGM surveys were accomplished. Figure 5-2 shows an overall chart of the QC steps. A summary of the QC methods is provided in Section 5 of the Geophysical Investigation Report, which is provided in Appendix D.

5.1.2.5 The geophysical systems were field-tested as specified in the geophysical investigation plan included in the Final RI/FS Work Plan (CH2M, 2016). A summary of the tests performed for DGM instrumentation is presented in Table 5-3. The geophysical subcontractors and CH2M performed QC of geophysical data and data deliverables at each step of the processing path. Results were checked by the subcontractor's QC geophysicist before delivery to CH2M and subsequently checked by the CH2M QC Geophysicist. Additional details on QC field testing are provided in the Geophysical Investigation Report (Appendix D).

5.1.3 Geophysical System Verification

5.1.3.1 The geophysical system verification (GSV) process was used to validate EM61-MK2 towed-array prior to and during use for site surveys. The GSV is a physics-based presumptively selected technology process in which signal strength and sensor performance are compared to known response curves of ISOs to verify DGM systems prior to and during site surveys. The process is designed to perform initial verification of EM61-MK2 systems using an IVS followed by a blind seeding program for continued verification throughout the field operations.

5.1.3.2 The ISOs used were 1-inch (2.54-centimeter) by 4-inch (10.16-centimeter) steel pipes. The IVS test was conducted in accordance with the RI/FS Work Plan (CH2M, 2016) as described in the IVS Report (Appendix E). The EM61 was verified as being within industry standards and meeting project measurement quality objectives.

5.1.3.3 ISOs consisting of 1-inch (2.54-centimeter) by 4-inch (10.16-centimeter) steel pipes were also placed as blind seeds in the shallow subsurface at locations unknown to DGM survey and data processing personnel. QC seed items were placed such that, on average, one seed item was encountered for each day of DGM survey. The seed locations were checked using a hand-held analog geophysical instrument to confirm that no existing anomalies were present at the seed location. Once placed, the orientation and inclination were recorded and depth to center of mass and locations of all seeded items was surveyed, and the locations provided to the CH2M QC Geophysicist. The items were placed at easily detectable depths in order to have a signal-to-noise ratio that allows comparison to known industry standard target values. Detection of the QC seed items was monitored by the CH2M QC

Geophysicist. All blind seeds were successfully detected, selected and recovered during the DGM surveys and intrusive investigation processes.

5.1.3.4 The systems were also validated through the process illustrated on Figure 5-2 and the criteria shown in Table 5-4 in accordance with the Geophysical Investigation Plan (Attachment F of the RI/FS Work Plan [CH2M, 2016]).

5.1.4 Data Interpretation

5.1.4.1 Each set of data was evaluated with respect to anomaly characteristics such as amplitude, size, shape, noise, and positional data) as detailed in the Geophysical Investigation Report (Appendix D).

5.1.4.2 To target small munitions items and include anomalies potentially related to munitions components, as well as those representing fully intact munitions items expected at the site, a threshold of 3 millivolts (mV) in the second EM61-MK2 time gate was selected for anomaly identification. Production and daily static test data were monitored to ensure the threshold level was sufficiently above local background and noise levels, and targets were selected from geophysical data using the UX-Detect module. The UX-Detect module within Oasis Montaj identifies peak amplitude responses associated with, but not limited to, munitions. Single-source anomalies may generate multiple target designations depending on shape and orientation. Initial target selections were auto-selected using the Blakely Test within the UX-Detect module based on the Channel 2 data of the EM61-MK2 bottom coil. Data profiles corresponding to the anomalies selected by Geosoft were then analyzed by trained geophysicists, with the targets evaluated as to their validity and position. Targets found to be invalid or incorrectly located were removed or adjusted. Additionally, anomalies that were not selected by the UX-Detect module, yet deemed to represent potential MEC targets, were manually selected. All selected anomalies that occurred at or above the targeting threshold of 3 mV were identified using a unique ID number. If a target response exhibited adequate decay yet was below the targeting threshold, it was selected as a target and noted as a below threshold pick.

5.1.5 DGM Data Collection Support

5.1.5.1 The following major activities were conducted as part of the terrestrial DGM for the RI/FS:

- Performed surface clearance to ensure site activity safety and remove surface metal that would impede subsurface target detection
- Performed vegetation reduction in conjunction with anomaly avoidance to prepare transects for geophysical operations
- Established an IVS using anomaly avoidance for DGM system validation
- Established survey stakes incorporating anomaly avoidance procedures as survey control for DGM crews
- Buried “blind” QC seeds (except in wetland areas due to access)
- Processed and interpreted DGM data and selected statistically representative sample of DGM anomalies potentially representing munitions

5.1.6 DGM Results

5.1.6.1 A total of 439 point-source anomalies with unknown metallic sources that could potentially be MEC or MPPEH in the subsurface were identified, as shown on Figure 5-1 (see also Appendix G). The geostatistical density mapping tool in Visual Sample Plan was utilized to extrapolate the anomaly density across DSA 1 based on the locations of the DGM transects and the anomalies identified along those transects (Appendix G). Anomaly density is low across the majority of the site (see Appendix G), with the exception of the shipping facility parking lot and railroad tracks, where higher anomaly concentrations

are observed, some of which may be related to underground utilities. A statistically representative selection of anomalies from both higher-density and lower-density areas was selected as described in Appendix G.

5.1.6.2 To determine if the identified DGM anomalies are related to munitions items, the Estimating a Proportion method was used to calculate the number of randomly selected DGM anomalies that should be intrusively excavated to estimate with a 95 percent confidence level and a ± 5 percent sampling error the proportion of munitions-related to non-munitions-related items. Because the anomaly population size was large, the necessary sample size of DGM anomalies to be intrusively investigated was estimated using the following statistical sample size formula:

$$n_0 = \frac{Z_{\alpha}^2 pq}{e^2}$$

Where:

- Z_{α} = desired confidence level
- p = proportion of DGM anomalies classified as munitions-related
- q = proportion of DGM anomalies classified as non-munitions-related ($q = 1-p$)
- e = acceptable margin of error for proportion being estimated
- n_0 = statistical sample size for a large population

5.1.6.3 To conservatively estimate the variance of proportional variables (i.e., munitions-related or non-munitions-related), pq (in the equation above), a population proportion of 50 percent ($p = 0.5$) was estimated to maximize the variance, and subsequently maximize the sample size. Using a z-statistic for a 95 percent confidence level ($Z_{\alpha} = 1.96$) and a margin of error of 5 percent ($e = 0.05$), the solution for n_0 becomes:

$$n_0 = \frac{Z_{\alpha}^2 pq}{e^2} = \frac{1.96^2 (0.5)(0.5)}{0.05^2} = 384$$

5.1.6.4 A maximum of 384 randomly selected DGM anomalies was estimated for classifying, with 95 percent confidence level and ± 5 percent sampling error, the proportion of munitions-related to non-munitions-related DGM anomalies.

5.1.6.5 The following finite population correction was then used to reduce the number of anomalies required to obtain the same confidence level:

$$n_1 = \frac{n_0}{1 + \left(\frac{n_0}{N} \right)} = \frac{384}{1 + \frac{384}{439}} = 204.83$$

Where:

- n_1 = adjusted statistical sample size for a finite population
- n_0 = statistical sample size for a large population
- N = size of the population (number of DGM anomalies)

5.1.6.6 The result shows that intrusively investigating 205 anomalies will provide a statistically derived estimate of the distribution of munitions-related to non-munitions-related items present among the anomalies identified along the DGM transects at 95 percent confidence level and within ± 5 percent sampling error. The addition of two QC seed items were added, resulting in a total of 207 anomalies for investigation. The anomalies selected for investigation are provided with coordinates and amplitude in the January 3, 2015 Technical Memorandum included in Appendix G. The number of anomalies actually selected for investigation was increased to 227 in the field due to the number of initial targets unable to be investigated (underwater or the roadway).

5.1.7 Reacquisition of Anomalies

5.1.7.1 Following the completion of the Phase 1 DGM and data evaluation the intrusive investigation of the selected anomalies (Phase 2 Investigation) was initiated with the anomaly reacquisition. A list of target anomalies and their coordinates was generated and provided to the advance intrusive investigation team for reacquisition using an RTK-GPS. The locations of each selected anomaly were flagged by the anomaly reacquisition team using a blue polyvinyl chloride survey flag placed 1 foot north of the actual field location. Each flag was marked with a unique anomaly identification.

5.1.8 Intrusive Investigation

After reacquisition, the intrusive investigation team mobilized to the sites.

5.1.8.1 Accountability and Records Management of MEC

5.1.8.1.1 The collection of accurate and detailed data is essential to documenting MEC-related discoveries and resulting disposition of MEC for future reference. CH2M controlled the entire munitions response project process, documentation, and QC through the use of the CH2M Munitions Response Site Information Management System (MRSIMS). MRSIMS is a cradle-to-grave data management system designed to track and query data for munitions response projects. MRSIMS employs hand-held devices used by the field teams with preprogrammed software to digitally capture, track, and upload data daily into the data management system. MRSIMS creates automated reports on the following:

- Project information (e.g., personnel, teams, instrument serial numbers, grid/transect IDs and locations)
- Field team leader notes (e.g., safety meetings, logbooks, field requests to management)
- DGM and UXO field team notes (e.g., transect, files, personnel, methods, instruments, MEC items found)
- DGM data processing notes and delivery data (e.g., file names, processing performed, QC of data, delivery dates)
- Grid statuses (e.g., activities performed by grid/transect and by acre, percents, and quantities complete or remaining)
- Demolition tracking
- QC (e.g., QC on notes, data, processing, comparison of DGM results to investigation results and field activities)

5.1.8.1.2 MRSIMS operates in a multiple contractor-capable environment with tools for digital data capture, storage, analysis, and QC. The result is a near “real-time” turnaround of project data to the management team. Field operations data are captured using hand-held devices and mobile forms-based software. The data are transferred to and then validated within a centralized relational database before being distributed. Digital MEC, material documented as an explosive hazard, and material documented as safe (MDAS) tracking forms in the MRSIMS devices were used to list data for each item encountered. Manual dig sheets were also maintained as a backup and for QC purposes.

5.1.8.2 Quality Control

5.1.8.2.1 QC methods for the MEC investigation included testing equipment prior and post use, reviewing the process and procedural checks performed during the sweep operations of the intrusive investigation, inspecting the area for MEC, surveying the area for blind seeds, and checking that the correct personal protection equipment is being used per the QC plan in the RI/FS Work Plan (CH2M, 2016). There were no QC failures during the Subareas 6 and 6A and DSA 1 RI field effort.

5.1.8.3 Anomaly Investigations

5.1.8.3.1 After reacquisition, the intrusive investigation team mobilized to work areas, as designated by the SUXOS, for investigation. The investigation team used (after daily QC checks) an EM61-MK2 time domain portable metal detector during the anomaly characterization work in addition to a Schonstedt and Whites XLT all-metals detector to locate each anomaly, based on the proximity of the survey flag placed by the reacquisition team. The following general procedure was used to manually investigate anomalies:

- The source of the anomaly was considered MEC/MPPEH until it was excavated and identified. The excavation was initiated adjacent to the geophysical anomaly and continued downward until the excavated area had reached a depth below the top of the item, as determined by frequent inspection with the instrument.
- Using progressively smaller and more-delicate tools to carefully remove the soil, the excavation team expanded the sidewall to expose the metallic item in the wall of the excavation for inspection and identification without moving or disturbing the item.

5.1.8.3.2 Once an item was removed (where possible) from the anomaly location, the location was rechecked with the EM61-MK2 to ensure that no other items were present. One anomaly location was unable to be investigated because of its position under the old pier pilings and was deemed too hazardous from a health and safety standpoint to investigate.

5.2 DGM Results

5.2.1 Initial Anomaly Investigation

5.2.1.1 Initial investigation of anomalies identified for Subareas 6 and 6A and DSA 1, completed in January and February 2014, is summarized below. Additional details are provided in Appendix G.

5.2.1.2 The initial Subareas 6 and 6A and DSA 1 anomaly investigation was conducted from January 29 through February 7, 2014. Frag items and an empty grenade fuze (TDSA1-3-00058, “Fuze, Grenade, Hand, M10 series”, expended) were recovered at six of the 227 anomaly locations initially investigated. Anomalies were identified at depths from ground surface to 4 feet below ground surface. Seven rifle grenade flares “Signal Ground Illumination” were recovered from one of the anomaly locations (TDSA1-2-00013, all were expended, no filler); only one munitions item was recovered from each of the remaining five locations (Figure 5-1). All of the munitions items were certified as MDAS, and all were located on the south-central side of DSA 1, with four falling within the Subarea 6 boundary. Locations of the munitions items are shown on Figure 5-3. Of the remaining anomalies, two were QC seeds, and 175 were identified as non-munitions scrap. The discovery of multiple no contacts during the reacquisition process prompted the QC evaluation and resurvey as indicated in Section 5.1 and documented in Appendix G.

5.2.2 DGM Resurvey

5.2.2.1 On February 7, 2014, NAEVA was notified by email that one of the grid blocks in DSA 3, investigated after work had been conducted at Subareas 6, 6A, and DSA 1, had a significant number of no contacts during the intrusive operations, and these no contacts were targets selected on suspected noise. Upon review, CH2M’s Principal Technologist determined that the data collected by the towed array system was questionable based on noise exhibited in the IVS tests on December 11, 12, and 17, 2013, and similar noise was also identified in a significant number of transects.

5.2.2.2 A resurvey and new anomaly selection for DSA 1 was completed in May 2014. The resurvey was conducted using the same array systems as the original survey.

5.2.2.3 The approach to the combined analysis was as follows:

1. Determine quantity of original anomalies selected (randomly) for investigation that can be used in characterization effort. Beginning with total anomalies investigated:

- Remove all “No Contacts” (28)
- Remove all “Underwater” (11)
- Remove all QC seeds dug (2)
- Remove all “other” (e.g., survey stake, road, parking lot, etc.) (29)

Resulting number is the quantity of randomly selected anomalies from the first dataset that are real anomalies caused by metal as opposed to noise by the system. (187)

2. Calculate total quantity of anomalies between both data sets (newly detected anomalies). (318)
3. Determine quantity of randomly selected anomalies requiring investigation to achieve 95 percent confidence in makeup of anomaly population along transects in area using the Estimating a Proportion statistical technique described in the RI/FS Work Plan (CH2M, 2016) plus anomalies that had their sources removed during intrusive investigation, to determine TOTAL real anomalies in the area for statistical calculations. (174)
4. Subtract quantity determined in #1 (real anomalies investigated in initial investigation effort) from #3 to determine quantity of additional (randomly selected) anomalies needing investigation. (0)

5.2.2.4 Although no additional intrusive investigation was required for Subareas 6 and 6A and DSA 1, an additional 29 anomalies were investigated in May and June 2014. Of these items, two were QC seeds, three were underwater, six were “other” (fence and backfill area), and the remaining were miscellaneous non-munitions items.

5.2.3 Investigation Results Summary

5.2.3.1 A total of 318 point-source anomalies with unknown metallic sources that could potentially be MEC or MPPEH in the subsurface were identified along the DGM transects. Of these, a total of 205 locations were intrusively investigated comprised of 187 anomaly locations initially investigated plus 18 locations investigated in May and June 2014 (not including the 3 underwater, 2 QC seeds, and 6 fence/backfill locations) (Figure 5-1). MD was recovered from 6 anomaly locations (Figure 5-3), consisting of frag items and an empty grenade fuze. All items were certified as MDAS. The remainder of the anomaly sources at DSA 1 were non-munitions-related items (scrap metal and miscellaneous debris). Based on these results, the population of anomalies represented on the transects consists of 2.9 percent MD items and 97.1 percent non-munitions-related items. Results from the RI are consistent with previous work, such as the 1992 Phase I RI and the 1993 investigation, where only inert munitions related items were identified.

5.3 MC Characterization

5.3.1 Phase 3 of the investigation approach was intended to perform MC sampling to determine the nature and extent of potential releases that may be associated with MEC finds, if warranted, based on the Phase 2 results. Because MEC was not found during Phase 2 at Subareas 6 and 6A or DSA 1, there is not a source of MC and, therefore, MC characterization is not warranted. Background sampling of DSA 1 for the DSA background investigation is detailed in Appendix A.

Human Health Risk Assessment

6.0.1 An HHRA was conducted for Areas 6, 6A, 6B and DSA 1 at the former Arsenal. The purpose of the HHRA was to estimate the potential risks to human receptors associated with exposures to constituents detected in surface soil, subsurface soil, surface water, and sediment within Areas 6, 6A, 6B and DSA 1. The HHRA was conducted in accordance with guidance from the EPA, NJDEP, and USACE. The approach and methodology used to conduct the HHRA was provided in the RI/FS Work Plan (CH2M, 2016) and is presented in Appendix H. The results of the HHRA will be used in the site management decision-making process for Areas 6, 6A, 6B and DSA 1.

6.0.2 Chemicals that are likely naturally occurring and/or related to anthropogenic background sources were evaluated by comparing site concentrations to background levels, as well as using other lines of evidence, to determine if they were related to former operations at Areas 6, 6A, 6B and DSA 1. Future site management decisions will address only the chemicals related to the former site munitions storage and disposal operations. Coincidental chemicals present in site media that are related to background levels due to natural mineralogy, pesticide applications from facility maintenance, or non-point anthropogenic sources (e.g., PAHs from vehicular traffic or asphalt pavements) are not identified as releases related to DoD activities at Areas 6, 6A, 6B and DSA 1.

6.0.3 The site-specific data evaluation, selection of COPCs, exposure assessment, toxicity assessment, risk characterization (risk estimates), and uncertainty analysis for Areas 6, 6A, 6B and DSA 1 are discussed in the following sections. The risk assessment results are presented in Tables 6-1 through 6-5. Additional tables for the HHRA are provided in Appendix H, Attachments H-1 through H-6. The text describing the methodology and approach used to conduct the HHRA is also provided in Appendix H.

6.1 Data Evaluation and Identification of COPCs

6.1.1 This section summarizes the data evaluated in the HHRA for Areas 6, 6A, 6B and DSA 1 and presents the COPCs selected for further evaluation.

6.1.1 Summary of Data Evaluated in Risk Assessment

6.1.1.1 Analytical data for surface soil (0 to 2 feet bgs), subsurface soil (2 feet bgs to the depth of the water table), surface water, and sediment samples collected at Areas 6, 6A, 6B and DSA 1 were evaluated in the HHRA. Soil, sediment, and surface water data collected from August 1994 through September 2005 were evaluated in the HHRA. The soil, sediment, and surface water samples were analyzed for SVOCs, VOCs, pesticides/PCBs, dioxins and furans, explosives, and metals. A total of 55 surface soil, 11 subsurface soil, 29 surface water, and 34 sediment samples were used in the HHRA. The samples used in the HHRA are listed in Attachment H-2 of Appendix H. The analytical data associated with these samples are described in Section 3.3 and are provided in Appendix B.

6.1.1.2 As discussed in Appendix H, the carcinogenic PAHs (cPAHs) were evaluated by summing doses of component PAHs after scaling the doses relative to the potency of an index PAH (i.e., benzo[a]pyrene). Relative potency factors (RPFs) were applied to the concentrations of the component PAHs and the concentrations were summed to derive the benzo(a)pyrene equivalent (BEQ) concentration (EPA, 1993). Similarly, the dioxins and furans were evaluated as 2,3,7,8-TCDD TEQ concentrations using the TEF methodology (EPA, 2010), as discussed in Appendix H.

6.1.2 Screening Criteria

6.1.2.1 The COPC selection process included comparison of the maximum detected concentration of each constituent against EPA's *RSLs for Chemical Contaminants at Superfund Sites* (EPA, 2018), as discussed in detail in Section 2.2 in Appendix H. If the maximum detected concentration of a chemical exceeded the RSL, it was identified as a COPC. Chemicals that were not detected in any of the samples within an environmental medium were not included in the COPC selection process. Additionally, commonly occurring essential nutrients, including calcium, magnesium, potassium, and sodium, were not selected as COPCs.

6.1.2.2 Detected inorganic chemicals in site soil were also compared to BTVs. The BTVs are the 95 percent UTL of the 95th percentile (95/95 UTL) for the background soil samples collected from DSAs 1, 2, 3, and 5. The background sampling approach and derivation of the BTVs for the DSAs is provided in Appendix A; the BTVs are summarized in Table 6-1. As recommended in the *Defense Environmental Restoration Program (DERP) Management Manual* (DoD, 2012) and the *Tri-Service Position Paper on Background Levels in Risk Assessment* (USACE, 2011) chemicals that are consistent with background levels should not be identified as site-related COPCs and should not be quantitatively evaluated in the exposure assessment and risk characterization. However, EPA risk assessment guidance recommends carrying forward all inorganic chemicals above risk-based threshold levels as COPCs, regardless of their occurrence in background soils (EPA, 2002a). For a conservative evaluation, the EPA guidance was followed for selection of COPCs in the HHRA. The uncertainty associated with the COPCs occurring both in site soils and background soils at similar concentrations is discussed further in Section 6.5.4.

6.1.2.3 As recommended by NJDEP, the analytical data were also screened against NJDEP SRS values; however, the NJDEP criteria were not used in the COPC selection process. The results of this screening were used for informational purposes and are discussed in Section 6.5.3.

6.1.3 Constituents of Potential Concern

6.1.3.1 The COPC screening for Areas 6, 6A, 6B and DSA 1 is provided in Tables 2.1 through 2.4 of Attachment H-1 in Appendix H for surface soil, subsurface soil, surface water, and sediment. The COPCs identified for Areas 6, 6A, 6B and DSA 1 are summarized in Table 6-2 and listed below:

- **Surface Soil (0 to 2 feet bgs)** – Ten inorganic chemicals (aluminum, antimony, arsenic, cadmium, cobalt, iron, manganese, mercury, thallium, and vanadium), 2,3,7,8-TCDD TEQ, and BEQ were identified as COPCs in surface soil.
- **Subsurface Soil (2 to 7.7 feet bgs)** – Five inorganic chemicals (antimony, arsenic, cobalt, iron, and vanadium), one pesticide (heptachlor epoxide), 2,3,7,8-TCDD TEQ, and BEQ were identified as COPCs in subsurface soil.
- **Surface Water** – Sixteen inorganic chemicals (aluminum, antimony, arsenic, beryllium, cadmium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, thallium, vanadium, and zinc), one SVOC (bis[2-ethylhexyl]phthalate) and one VOC (trichloroethene [TCE]) were identified as COPCs in surface water.
- **Sediment** – Eleven inorganic chemicals (aluminum, antimony, arsenic, cadmium, cobalt, iron, manganese, mercury, nickel, thallium, and vanadium), one PCB (Aroclor-1260), one pesticide (4,4-DDD), 2,3,7,8-TCDD, and BEQ were identified as COPCs in sediment.

6.1.3.2 The COPCs identified for surface and subsurface soil were combined to identify the COPCs for the soil samples collected from the 0- to 7.7-foot depth interval, referred to as total soil.

6.2 Exposure Assessment

6.2.1 A CSM for Areas 6, 6A, 6B and DSA 1 is presented in Section 4. A general discussion of the role of exposure assessment and the exposure assessment methodology is included in Section 3 in Appendix H. The three components of the exposure assessment for Areas 6, 6A, 6B and DSA 1 are as follows:

- Characterization of exposure setting
- Identification of potential exposure pathways
- Quantification of exposure

6.2.2 Each of these steps is discussed below.

6.2.1 Characterization of Exposure Setting

6.2.1.1 The first step of the exposure assessment was to evaluate Areas 6, 6A, 6B and DSA 1 with respect to the physical characteristics and potential receptor populations under current and assumed future site conditions. The former Arsenal site is located on the north bank of the Raritan River and encompasses approximately 3,200 acres. The former Arsenal is bordered to the north and northwest by Woodbridge Avenue, to the southwest by Mill Road and the Industrial Land Reclamation Landfill, and to the south and east by the Raritan River.

6.2.1.2 Areas 6, 6A, 6B are in the eastern portion of the former Arsenal adjacent to the Raritan River, as shown on Figure 1-2. Areas 6, 6A, 6B encompass approximately 130 acres and DSA 1 encompasses approximately 89 acres.

6.2.1.3 Areas 6, 6A, 6B are mostly undeveloped wetland that is owned by FBC. The only development is the demolished remnants of the LaPlace, Inc. sulfuric acid manufacturing plant in Area 6A, which is currently a shipping facility parking lot. An occasional maintenance worker could visit the site while performing landscaping and maintenance activities. If future development occurs at the site, industrial/commercial workers and construction workers could be potential receptors. The wetland areas adjacent to the river may also be accessible to offsite public visitors, so future recreational users/trespassers are also considered potential receptors at the site.

6.2.1.4 Based on the current and possible future land use for Areas 6, 6A, 6B and DSA 1, the following receptors were quantitatively evaluated in the HHRA: current and future maintenance workers, future industrial/ commercial workers, future recreational users/trespassers, future construction/utility workers, and future hypothetical residents. Residential development at Areas 6, 6A, 6B and DSA 1 is unlikely; however, a hypothetical future residential scenario was included in the HHRA to evaluate the potential for unrestricted land use as an option during site management decisions.

6.2.2 Identification of Exposure Pathways

6.2.2.1 An exposure pathway can be described as the physical course that a COPC takes from the point of release (or source) to a receptor. The CSMs for Areas 6, 6A, 6B and DSA 1 are presented on Figures 4-1 and 4-2. The potential exposure pathways for Areas 6, 6A, 6B and DSA 1 are also identified in a tabular format in Table 1 in Attachment H-1 of Appendix H. Potential exposures to site surface soil (0 to 2 feet bgs), combined surface and subsurface soil (0 to 7.7 feet bgs), sediment, and surface water were evaluated in the HHRA. The depth interval of 0 to 2 feet bgs for surface soil is based on the assumption that soil up to 2 feet bgs could be disturbed and available for direct contact as a result of landscaping, outdoor play activities, and outdoor maintenance activities, such as digging, planting, and/or removal of vegetation.

6.2.2.2 The following text describes the exposure pathways that were quantitatively evaluated for the HHRA:

- **Maintenance Worker (Current/Future)** – Maintenance workers are assumed to be involved with landscaping activities and building maintenance. Ingestion, dermal contact, and inhalation exposures to COPCs in surface soil (0 to 2 feet bgs) at Areas 6, 6A, 6B and DSA 1 were quantified for maintenance workers.
- **Adult, Adolescent, and Child Recreational User/Trespasser (Future)** – It is possible that a recreational user/trespasser may access the site from the adjacent Raritan River. Therefore, a recreational/trespasser scenario was evaluated for Areas 6, 6A, 6B and DSA 1. Ingestion, dermal contact, and inhalation exposures to COPCs in surface soil (0 to 2 feet bgs) were quantified for recreational users/trespassers. Ingestion and dermal contact exposures to COPCs in surface water and sediment were also quantified for recreational users/trespassers assumed to be wading through the streams located within Areas 6, 6A, 6B and DSA 1.
- **Industrial/Commercial Worker (Future)** – A future industrial worker is assumed to have a higher frequency and duration of exposure to site soil compared to other workers (e.g., maintenance workers). Ingestion, dermal contact, and inhalation exposures to COPCs in surface soil (0 to 2 feet bgs) were quantified for industrial/commercial workers.
- **Construction/Utility Worker (Future)** – If the site is developed in the future, it is possible that construction activities or utility installation and maintenance activities could occur that result in exposures to site surface and subsurface soils. Therefore, a construction/utility worker scenario was evaluated for Areas 6, 6A, 6B and DSA 1. Ingestion, dermal contact, and inhalation exposures to COPCs in combined surface and subsurface soils, identified as total soil (0 to 7.7 feet bgs), were quantified for construction/utility workers.
- **Hypothetical Adult and Child Residents (Future)** – As previously stated, it is unlikely Areas 6, 6A, 6B and DSA 1 will be developed for residential use; however, the potential for future unrestricted land use was evaluated by including a hypothetical residential scenario. Ingestion, dermal contact, and inhalation exposures to COPCs in surface soil (0 to 2 feet bgs) and total soil (0 to 7.7 feet bgs) were quantified for hypothetical residents. Surface water and sediment were not quantitatively evaluated for a hypothetical resident because these media are evaluated under the recreational user/trespasser scenario. The recreational user/ trespasser receptors could be considered the future residents living near the areas with surface water.

6.2.2.3 The potentially complete pathways for Areas 6, 6A, 6B and DSA 1 are summarized in Table 6-3.

6.2.3 Quantification of Exposure

6.2.3.1 To evaluate the potentially complete exposure pathways further, the magnitude, frequency, and duration of exposures were estimated and quantified. Exposure point concentrations (EPCs) were identified and pathway-specific intakes were estimated based on an RME scenario.

6.2.3.2 The EPC is the concentration of a COPC at the point of contact to a human receptor. EPCs were estimated for each COPC identified in surface soil, subsurface soil, surface water, and sediment at Areas 6, 6A, 6B and DSA 1. The approach used to calculate EPCs is presented in Section 3.3 of Appendix H. The EPCs for each medium are included in Tables 3.1 through 3.4 of Attachment H-1 in Appendix H, and the ProUCL output is provided in Attachment H-3 of Appendix H.

6.2.3.3 The EPCs and exposure factors were used to calculate pathway-specific intakes for COPCs in soil, surface water, and sediment for potential receptors at Areas 6, 6A, 6B and DSA 1. The exposure factors used for each receptor are presented in Tables 4.1 through 4.8 of Attachment H-1 in Appendix H. Additionally, the chemical-specific dermal absorption factors for each COPC identified in soil and

sediment are presented in Table 4.1 Supplement of Attachment H-1 in Appendix H. The exposure factors used to quantify exposures for COPCs that act through a mutagenic mode of action, are provided in Attachment H-1 of Appendix H, Tables 4.3 Supplement and 4.4 Supplement for surface soil, Table 4.5 Supplement for surface water, Table 4.6 Supplement for sediment, and Tables 4.7 Supplement and 4.8 Supplement A for total soil. A site-specific particulate emission factor (PEF) was estimated for maintenance workers, recreational users/ trespassers, industrial/commercial workers, and hypothetical future residents using an exposure area of 1 acre, a wind speed of 5.36 meters per second, and default assumptions from EPA (2002b) guidance (Table 4.2 Supplement of Attachment H-1 in Appendix H). Another PEF was estimated for a construction/ utility worker using an exposure area of 1 acre and default assumptions from EPA (2002b) guidance (Table 4.8 Supplement B of Attachment H-1 in Appendix H).

6.3 Toxicity Assessment

6.3.1 The toxicity assessment identifies the toxicity values for the COPCs used to estimate potential health effects from exposures to site media. The cancer slope factors, reference doses, inhalation unit risk factors, and reference concentrations used in the HHRA were obtained from the EPA-recommended hierarchy of sources for toxicity factors (EPA, 2003), as follows:

- **Tier 1** – EPA’s Integrated Risk Information System database (EPA, 2019)
- **Tier 2** – Provisional Peer Reviewed Toxicity Value database maintained by the EPA’s National Center for Environmental Assessment and the Superfund Health Risk Technical Support Center
- **Tier 3** – Other EPA and non-EPA sources including the Agency for Toxic Substances and Disease Registry (ATSDR) Minimal Risk Levels (ATSDR, 2018), Health Effects Summary Tables (EPA, 1997a), and California Environmental Protection Agency Toxicity Criteria Database (2019)

6.3.2 A detailed discussion of the toxicity assessment is provided in Section 4 of Appendix H. The non-carcinogenic toxicity values used in the HHRA are provided in Tables 5.1 and 5.2 of Attachment H-1 in Appendix H, and the carcinogenic toxicity values are provided in Tables 6.1 and 6.2 of Attachment H-1 in Appendix H.

6.4 Risk Characterization

6.4.1 Potential carcinogenic risks and noncarcinogenic hazards were estimated for the COPCs for various receptors. The estimated risks and HIs were compared to EPA’s acceptable cancer risk management range and HI values. EPA generally considers an acceptable excess lifetime cancer risk (ELCR) range for a site to be within 1 to 100 in a million (1×10^{-6} to 1×10^{-4}) and an acceptable noncarcinogenic HI to be 1 or less (EPA, 1989). A risk level of 1×10^{-4} corresponds to the upper-end of EPA’s acceptable risk range, as discussed in the National Contingency Plan, 40 *Code of Federal Regulations* (CFR) Section 300.430. The upper boundary of the risk range is not a discrete line at 1×10^{-4} ; however, EPA generally uses 1×10^{-4} in making risk management decisions (EPA, 1991). Therefore, when a cumulative ELCR for a receptor group is less than 10^{-4} and the non-carcinogenic hazard quotient is less than 1 based on RME conditions, action generally is not warranted unless there are adverse environmental impacts (EPA, 1991). A discussion of the risk characterization methodology is provided in Section 5 of Appendix H.

6.4.1 Summary of Risk Estimates

6.4.1.1 The estimated ELCRs and HIs are based on potential exposures to the COPCs in surface soil, total soil, surface water, and sediment for the potential receptors discussed in the exposure assessment section for Area 6, 6A, 6B and DSA 1. The ELCR and HI calculations are provided in Tables 7.1 through 7.12 and are summarized in Tables 9.1 through 9.12 of Attachment H-1 in Appendix H.

6.4.1.2 Background ELCR and HI estimates were calculated for the soil inorganic COPCs to determine the background-related risks at the site. The background ELCR and HI calculations for soil are provided in Tables 7.1 through 7.12 and are summarized in Tables 9.1 through 9.12 of Attachment H-4 in Appendix H.

6.4.1.3 Table 6-4 summarizes the ELCRs and HIs estimated by receptor and exposure route. A comparison of the estimated site risks and background-related risks for the COPCs is provided in Table 6-5. Figures 6-1 and 6-2 present the graphic bar charts of the estimated site soil risks and background risks for each receptor group. The cumulative ELCRs and non-cancer HIs estimated for Areas 6, 6A, 6B and DSA 1 are discussed below for each exposure scenario:

- **Maintenance Worker – Current/Future Scenario**

- Potential exposures to surface soil through ingestion, dermal contact, and inhalation were estimated for a maintenance worker.
- The estimated site ELCR and HI were 3×10^{-5} and 0.4, respectively (Tables 7.1 and 9.1 in Attachment H-1 of Appendix H).
- The estimated background-related ELCR and HI were 3×10^{-5} and 0.3, respectively (Tables 7.1 and 9.1 in Attachment H-4 of Appendix H).
- The estimated site ELCR is less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated site HI is less than the EPA threshold of 1.

- **Recreational User/Trespasser – Future Scenario**

- Potential exposures to surface soil through ingestion, dermal contact, and inhalation were estimated for recreational users/trespassers (adult, adolescent, and child). Additionally, potential exposures to surface water and sediment through ingestion and dermal contact were also estimated. The estimated ELCRs and HIs are summarized below:
 - Adult: Cumulative ELCR of 3×10^{-5} and HI of 0.5 (Tables 7.2 and 9.2 in Attachment H-1 of Appendix H).
 - Adolescent: Cumulative ELCR of 2×10^{-5} and HI of 0.7 (Tables 7.3 and 9.3 in Attachment H-1 of Appendix H).
 - Child: Cumulative ELCR of 4×10^{-5} and HI of 2 (Tables 7.4 and 9.4 in Attachment H-1 of Appendix H).
 - The estimated site ELCRs for adult, adolescent, and child recreational users/trespassers are less than the upper-end (1×10^{-4}) of EPA's acceptable risk range. The HI for a child recreational user/trespasser is greater than the EPA threshold value of 1; however, none of the target-organ-specific HIs exceed 1.
- Background-related risks were estimated for surface soil. The estimated background-related ELCRs and HIs are summarized below:
 - Adult: Cumulative ELCR of 6×10^{-6} and HI of 0.08 (Tables 7.2 and 9.2 in Attachment H-4 of Appendix H).
 - Adolescent: Cumulative ELCR of 5×10^{-6} and HI of 0.1 (Tables 7.3 and 9.3 in Attachment H-4 of Appendix H).
 - Child: Cumulative ELCR of 2×10^{-5} and HI of 0.8 (Tables 7.4 and 9.4 in Attachment H-4 of Appendix H).

- **Industrial/Commercial Worker – Future Scenario**
 - Potential exposures to surface soil through ingestion, dermal contact, and inhalation were estimated for an industrial/commercial worker.
 - The estimated site ELCR and HI were 4×10^{-5} and 0.4, respectively (Tables 7.5 and 9.5 in Attachment H-1 of Appendix H).
 - The estimated background-related ELCR and HI were 3×10^{-5} and 0.4, respectively (Tables 7.5 and 9.5 in Attachment H-4 of Appendix H).
 - The estimated site ELCR is less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated site HI is less than the EPA threshold of 1.
- **Construction/Utility Worker – Future Scenario**
 - Potential exposures during construction/excavation activities to combined surface and subsurface soil (total soil) through ingestion, dermal contact, and inhalation were estimated for a construction/utility worker.
 - The estimated site ELCR and HI were 4×10^{-6} and 1, respectively (Tables 7.6 and 9.6 in Attachment H-1 of Appendix H).
 - The estimated background-related ELCR and HI were 4×10^{-6} and 1, respectively (Tables 7.6 and 9.6 in Attachment H-4 of Appendix H).
 - The estimated site ELCR is less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated site HI is equal to the EPA threshold of 1.
- **Hypothetical Resident – Future Scenario**
 - Future residential receptors (adult and child) were evaluated for direct exposure to surface soil and combined surface and subsurface soil (total soil) through ingestion, dermal contact, and inhalation. The estimated ELCRs and HIs are summarized below:
 - Surface Soil Results:
 - Adult: Cumulative site HI of 0.6 (Tables 7.7 and 9.7 in Attachment H-1 of Appendix H).
 - Child: Cumulative site HI of 6 (Tables 7.8 and 9.8 in Attachment H-1 of Appendix H).
 - Aggregate (adult and child): Cumulative site ELCR of 2×10^{-4} (Tables 7.9 and 9.9 in Attachment H-1 of Appendix H).
 - The estimated site ELCR is greater than the upper-end (1×10^{-4}) of EPA's acceptable risk range due to arsenic, BEQ, and 2,3,7,8-TCDD TEQ. The estimated site HI is greater than the EPA threshold of 1 for a child resident due to arsenic and vanadium.
 - The estimated background HIs for future adult and child residents were 0.6 and 6, respectively, and the estimated background ELCR for future residents was 2×10^{-4} (Tables 7.7 through 7.9 and Tables 9.7 through 9.9 in Attachment H-4 of Appendix H).
 - Combined Surface and Subsurface Soil (Total Soil) Results:
 - Adult: Cumulative site HI of 0.6 (Tables 7.10 and 9.10 in Attachment H-1 of Appendix H).
 - Child: Cumulative site HI of 6 (Tables 7.11 and 9.11 in Attachment H-1 of Appendix H).
 - Aggregate (adult and child): Cumulative site ELCR of 1×10^{-4} (Tables 7.12 and 9.12 in Attachment H-1 of Appendix H).

- The estimated site ELCR is equal to the upper-end (1×10^{-4}) of EPA's acceptable risk range. The estimated site HI is greater than the EPA threshold of 1 for a child resident due to arsenic and vanadium.
- The estimated background HIs for future adult and child residents were 0.6 and 6, respectively, and the estimated background ELCR for future residents was 2×10^{-4} (Tables 7.10 through 7.12 and Tables 9.10 through 9.12 in Attachment H-4 of Appendix H).

6.4.1.4 Overall, the estimated site ELCRs were less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated site HIs for each target organ were less than or equal to EPA's threshold of 1 for potential maintenance workers, recreational users/trespassers, industrial/commercial workers, and construction/utility workers (Table 6-4). For a residential scenario, the estimated site ELCR for surface soil exceeded the upper-end (1×10^{-4}) of EPA's acceptable risk range and the estimated HIs for surface and total soil exceeded EPA's threshold of 1. The ELCR and HI exceedances were primarily from arsenic in site soil. Arsenic was detected at concentrations attributable to background levels. As discussed in Section 3.5, a two-sample randomization (permutation) test was performed on the site soil and background data, and the results indicated that the arsenic concentrations in site soil were not statistically greater than the background concentrations (Table 3-11). After removing the background contributions for arsenic in soil, the estimated ELCRs and HIs are within acceptable levels for a residential scenario. Therefore, no constituents of concern (COCs) attributable to a DoD release were identified for soil, sediment, or surface water at Areas 6, 6A, 6B and DSA 1.

6.5 Uncertainty Analysis

6.5.1 The general uncertainties associated with the HHRA are discussed in Section 6 of Appendix H. Specific uncertainties for Areas 6, 6A, 6B and DSA 1 are discussed below.

6.5.1 Chemicals without Screening Levels

6.5.1.1 Soil and sediment screening levels were not available for three PAHs (acenaphthylene, benzo[g,h,i]perylene, and phenanthrene), one SVOC (dimethyl phthalate), and two pesticides (alpha-chlordane and gamma-chlordane). Therefore, surrogate chemicals were identified for the COPC screening (Tables 2.1 through 2.4 of Attachment H-1 in Appendix H) based on structural and functional similarities. Using surrogates in the COPC screening process could underestimate or overestimate potential risks for Areas 6, 6A, 6B and DSA 1; however, surrogate chemicals were conservatively selected for the chemicals that did not have screening levels. A screening level was not available for carbazole detected in site sediment and a surrogate chemical was not identified; however, carbazole was only detected in 1 of 27 sediment samples.

6.5.2 Screening of Non-detected Chemicals

6.5.2.1 For chemicals that were 100 percent non-detected in each environmental matrix (exposure domain), the maximum non-detected values were compared to their respective EPA RSLs. The results of the comparison are presented in Tables 1 through 4 of Attachment H-5 of Appendix H. Twenty-three analytes in surface soil had maximum non-detected concentrations greater than their respective residential soil RSLs, including explosives, PCBs, pesticides, VOCs, and SVOCs. In subsurface soil, 23 analytes had maximum non-detected concentrations exceeding their respective residential soil RSLs, including explosives, metals, PCBs, pesticides, VOCs, and SVOCs. Twenty-five and 81 non-detected analytes exceeded their respective RSLs in sediment and surface water, respectively. The elevated detection limits above criteria could be due to multiple reasons such as: analytical data were collected over time and analyzed by different laboratories; analytical detections have been refined/ lowered in more recent times; and toxicity criteria for some of the chemicals may have also become more conservative over time. Additionally, the tap water RSLs were used to screen the non-detect

concentrations in surface water, which is a conservative evaluation because it is unlikely surface water would be used as a potable water source.

6.5.3 Data Screening Using New Jersey Soil Remediation Standards

6.5.3.1 A separate screening evaluation was included in the HHRA that compared the maximum detected concentrations against the residential NJDEP SRS values (see Attachment H-6 of Appendix H). The results of the screening are provided below for each medium:

- **Surface Soil** – Arsenic, BEQ, and vanadium exceeded the NJDEP residential SRS. These chemicals also exceeded the EPA's RSLs.
- **Subsurface Soil** – Antimony, arsenic, BEQ, and heptachlor epoxide exceeded the NJDEP residential SRS and also exceeded the EPA's RSL.
- **Sediment** – Aroclor-1260, Arsenic, BEQ, and vanadium exceeded the NJDEP residential SRS. These chemicals also exceeded the EPA's RSLs.

6.5.3.2 Overall, fewer chemicals exceeded the NJDEP SRS values than the EPA's RSLs. All the chemicals that exceeded the NJDEP values also exceeded the EPA's RSLs, and therefore were included in the quantitative risk estimates in the HHRA. Therefore, there are no significant uncertainties associated with not including the NJDEP SRS in the COPC selection process for the HHRA.

6.5.4 COPCs Attributable to Background Levels

6.5.4.1 The inorganic chemicals detected at concentrations less than BTVs were included as COPCs for surface soil and subsurface soil. Five metals (cobalt, iron, manganese, mercury, and vanadium) were identified as COPCs in surface soil but were detected at concentrations less than their respective BTVs. Four metals (arsenic, cobalt, iron, and vanadium) were identified as COPCs in subsurface soil but were detected at concentrations less than their respective BTVs. Five COPCs (aluminum, antimony, arsenic, cadmium, and thallium) were detected in surface soil at concentrations greater than their respective BTVs; however, less than 5 percent of the detected site concentrations for antimony and arsenic exceeded the BTVs (i.e., over 95 percent of the site concentrations were less than the BTVs), suggesting their presence in site surface soil is related to background levels associated with the dredge spoils. Aluminum, cadmium, and thallium exceeded their respective BTVs in more than 5 percent of the site surface soil samples:

- Aluminum exceeded the BTV in 13 percent of the site surface soil samples. Aluminum was detected in site surface soil at concentrations ranging from 1,790 mg/kg to 28,700 mg/kg, compared to a BTV of 25,325 mg/kg.
- Cadmium exceeded the BTV in 6 percent of the site surface soil samples. Cadmium was detected in site surface soil at concentrations ranging from 0.049 mg/kg to 16.2 mg/kg, compared to a BTV of 3.4 mg/kg.
- Thallium exceeded the BTV in 15 percent of the site surface soil samples. Thallium was detected in site surface soil at concentrations ranging from 0.99 mg/kg to 3.4 mg/kg, compared to a BTV of 1.04 mg/kg.
- Neither aluminum, cadmium, nor thallium were identified as risk drivers in site surface soil; the estimated ELCR for cadmium and the HIs for all three constituents under a residential scenario were within the acceptable risk criteria (Tables 7.8 and 9.8 and Tables 7.9 and 9.9 of Attachment H-1 in Appendix H).
- One inorganic COPC (antimony) exceeded the BTV in subsurface soil. Antimony was detected in subsurface soil at concentrations ranging from 21.8 mg/kg to 33.8 mg/kg, compared to a BTV of

5.4 mg/kg. Antimony was not a risk driver in subsurface soil; the estimated HI for antimony was 0.1 for a hypothetical child resident potentially exposed to total soil (Tables 7.11 and 9.11 of Attachment H-1 in Appendix H).

6.5.4.2 Overall, based on the comparisons of site concentrations to the BTVs, it can be concluded that the majority of inorganic COPCs identified in site soil are likely related to the background levels associated with the dredge spoils deposited at Areas 6, 6A, 6B and DSA 1. Of the inorganic COPCs that were detected in more than 5 percent of site soil samples at concentrations greater than their respective BTVs, none were identified as risk drivers in site soil.

6.5.5 Exposure Point Concentrations

The site data collected from Areas 6, 6A, 6B and DSA 1 were combined as one dataset to estimate the EPCs (i.e., typically the upper confidence level [UCL] on the mean) in the HHRA. For comparison purposes, an area-weighted approach was also evaluated to determine if area-weighted UCLs would differ from the UCLs used in the HHRA. In the area-weighted approach, the estimated UCLs were weighted together to account for the relative portions of the area over which they are located. The soil data (0-7.7 feet bgs) were grouped by the three subareas (Area 6, Area 6A, and Area 6B), as shown in Figure 3-1, to estimate the weighted UCLs. The acreage used in the weighted UCL calculations was based on the area from which the soil samples were collected at each subarea. The weighted UCLs were calculated using the Interstate Technology and Regulatory Council's calculation spreadsheet, "Calculation of Weighted 95% UCLs for a Combined Decision Unit from Several Smaller Decision Units," as provided in Attachment H-7 of Appendix H. Only COPCs with more than one analytical result at each of the subareas were included in the weighted UCL calculations.

The area-weighted UCLs were slightly greater than the unweighted UCLs for three COPCs (arsenic, mercury, and thallium), as provided on Table 6-6. Arsenic and mercury were detected in site soil at concentrations less than background levels, as discussed in Section 6.5.4. Additionally, the area-weighted UCL for thallium would still result in acceptable hazards for potential receptors. Therefore, there would be no changes to the overall HHRA conclusions (i.e., no unacceptable risks or hazards for site-related COPCs) if the area-weighted UCLs were used to estimate potential risks for these COPCs in the HHRA.

6.5.6 Toxicity Values

6.5.5.1 Provisional toxicity factors are provided by EPA prior to a complete peer review and finalization of the toxicity factors. Therefore, the use of provisional toxicity factors is associated with a degree of uncertainty in the estimated risks in the risk assessment. Provisional toxicity values were used in the HHRA for several COPCs to quantify risks, as indicated in Tables 5.1, 5.2, 6.1, and 6.2 of Attachment H-1 in Appendix H. Therefore, the quantitative estimates of risk for these constituents are associated with greater uncertainty.

6.5.7 Risk Characterization

6.5.6.1 An important additional source of uncertainty is introduced in this phase of the HHRA—the combination of upper-bound intake estimates with upper-bound toxicity estimates. Generally, the goal of a baseline risk assessment is to estimate an upper-bound, but reasonable, potential risk. Most of the assumptions about exposure and toxicity used in this HHRA are representative of statistical upper-bounds for each parameter. The result of combining several such upper-bound assumptions is that the final estimate of potential risk is conservative.

6.5.6.2 There are uncertainties regarding the estimated risks for a future hypothetical residential scenario due to the limited number of soil samples from Areas 6, 6A, 6B and DSA 1. Additionally, it is

unknown how the site would be subdivided if the site was developed for residential use. The EPCs estimated over the entire site may not conservatively represent the EPCs for smaller residential parcels.

6.6 Summary and Conclusions

6.6.1 The HHRA for Areas 6, 6A, 6B and DSA 1 evaluated analytical data for surface soil (0 to 2 feet bgs), subsurface soil (2 to 7.7 feet bgs), sediment, and surface water. The potential receptors evaluated in the HHRA included current/future maintenance workers and future recreational users/trespassers, industrial workers, construction workers, and hypothetical residents. Areas 6, 6A, 6B and DSA 1 will likely remain primarily undeveloped in the foreseeable future. However, a hypothetical residential scenario was included to evaluate the potential for an unrestricted land use scenario. A summary of the risk results for each potential receptor is provided in Table 6-4. The potential exposure pathways and risk results are discussed below:

- Current and future **maintenance workers** were assumed to be exposed to surface soil (0 to 2 feet bgs). The estimated cancer risks and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified for a current/future maintenance worker scenario.
- Future **recreational users/trespassers** (adult, adolescent, and child) were assumed to be exposed to surface soil (0 to 2 feet bgs), surface water, and sediment. The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified for a future recreational user/trespasser.
- Future **industrial/commercial workers** were assumed to be exposed to surface soil (0 to 2 feet bgs). The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified in surface soil for a future industrial/commercial scenario.
- Future **construction/utility workers** were assumed to be exposed to total soil (0 to 7.7 feet bgs). The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified in total soil for a future construction/utility worker scenario.
- Future **residents** (adult and child) were assumed to be exposed to surface soil (0 to 2 feet bgs) and total soil (0 to 7.7 feet bgs). The estimated ELCRs and non-cancer HIs exceeded the acceptable risk criteria for surface soil and/or total soil and the exceedances were primarily from arsenic. Arsenic was detected in site soil at concentrations attributable to background levels. As discussed in Section 3.5, a two-sample randomization (permutation) test was performed on the site soil and background data, and the results indicated that the arsenic concentrations in site soil were not statistically greater than the background concentrations (Table 3-11). After removing the background contributions for arsenic in site soil, the estimated ELCRs and HIs are within acceptable levels for a residential scenario. Therefore, no COCs attributable to a DoD release were identified in surface soil or total soil for a future residential scenario.

6.6.2 Overall, the HHRA indicated that after removing the background contributions for arsenic, potential exposures to site soil, sediment, and surface water at Areas 6, 6A, 6B and DSA 1 would result in estimated ELCRs less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and estimated HIs less than the target organ HI of 1. Therefore, no COCs attributable to a DoD release were identified for Areas 6, 6A, 6B and DSA 1 based on the current and planned future land use for the site.

Ecological Risk Assessment

7.1 Introduction

7.1.1 This section completes a BERA addendum to evaluate the potential for ecological risk from DoD-related activities in Areas 6, 6A, 6B and DSA 1. Consistent with the ERA approach presented in Appendix K of the RI/FS Work Plan (CH2M, 2016), the following text only discusses the risks that could be associated with MC. The evaluation considered the results of the sitewide BERA (Weston, 2008). The sections that follow provide a qualitative evaluation of ecological risk associated with historical DoD-related activities in Areas 6, 6A, 6B and DSA 1.

7.2 Site/Habitat Description

7.2.1 The majority of Areas 6, 6A, 6B and DSA 1 consists of emergent wetland (*Phragmites*), with old field habitat occurring along the northeastern border of Area 6. Old field habitat is the dominant habitat in Subarea 6A, with estuarine emergent wetland (*Phragmites*) occurring along the southwestern corner of this area. Areas 6, 6A, and 6B wetlands are dominated by common reed (*Phragmites australis*), with small stands of saltmarsh cordgrass (*Spartina alterniflora*). The disturbed old field areas are dominated by grasses such as little bluestem (*Andropogon scoparius*), India grass (*Sorghastrum nutans*), and common reed (*Phragmites australis*), with some of the areas supporting woody vegetation, such as young gray birch (*Betula populifolia*) and staghorn sumac (*Rhus typhina*). The areas provide habitat for a variety of potential ecological receptors, including white-footed mouse (*Peromyscus leucopus*), short-tail shrew (*Blarina brevicauda*), white-tailed deer (*Odocoileus virginianus*), red foxes (*Vulpes fulva*), and possibly Norway rats (*Rattus norvegicus*).

7.2.2 Because the area contains wetlands, the site is considered an environmentally sensitive natural resource pursuant to the NJDEP's *Ecological Evaluation Technical Guidance* (NJDEP, 2015).

7.3 Ecological Risk Assessment and Conclusions

7.3.1 All eight steps of the ERA have been completed for the former Arsenal, consistent with the process described in EPA's *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (1997b). Steps 1, 2, and 3 of the ERA were presented in the following reports:

- *Final Screening-Level Ecological Risk Assessment Report, Former Raritan Arsenal, Edison, New Jersey* (Weston, 2004a)
- *Final Draft Problem Formulation – Baseline Ecological Risk Assessment, Former Raritan Arsenal Edison, New Jersey* (Weston, 2004b)

7.3.2 The ERA focused on the sitewide evaluation of ecological risks based on the evaluation of drainage areas, with a total of eight drainage areas identified for evaluation. The results of the screening-level ERA indicated the potential for ecological risk from chemicals in soil, sediment, and surface water within the eight drainage areas. The problem formulation statement (Weston, 2004b) then established the goals, breadth, and focus of the BERA, and presented a CSM that identified the potential chemical transport pathways, receptors, and areas of primary concern. It also presented a series of testable hypotheses and predictions for testing them, using a variety of measurement endpoints to evaluate ecological risks at the former Arsenal.

7.3.3 Step 4 (Study Design and DQO process) and the approach to Step 5 (Verification of Field Sampling Design), which were included as part of the BERA study design, were presented in the *Draft Final Baseline Ecological Risk Assessment Work Plan, Former Raritan Arsenal, Edison, New Jersey* (Weston, 2005a) and subsequently implemented during the BERA site investigation (first part of Step 6).

The sitewide BERA investigation included the following site-specific analyses:

- Chemical analysis of soil, sediment, and surface water
- Chronic soil bioassays with the earthworm *Lumbricus terrestris* (tissue data were not available for Areas 6, 6A, and 6B because no earthworms were present (due to sandy site conditions that do not provide adequate habit for earthworms to survive))
- Chronic sediment bioassays with the freshwater amphipod *Hyalella Azteca* and *Chironomus dilutus* (formerly called *Chironomus tentans*) and the estuarine amphipod *Leptocheirus plumulosus*
- Benthic macroinvertebrate community analysis
- Tissue residue chemical analysis of plant, earthworm (where present), small mammal, frog, fiddler crab, and fish

7.3.4 The BERA report incorporated the evaluation of these data (second part of Step 6, Data Analysis, and Step 7, Risk Characterization) and initiated Step 8 (Risk Management) of the ERA process. The *Ecological Risk Management Report, Former Raritan Arsenal, New Jersey* (Weston, 2011) was completed as a preliminary draft in July 2011, and presented risk management conclusions about the potential for adverse effects on ecological receptors at the former Arsenal.

7.3.5 Within the BERA, Areas 6, 6A, 6B and DSA 1 were evaluated as part of the Red Root Creek and Black Ditch drainage systems. Groundwater area of concern (AOC) AOC 19 is located within the Area 6, 6A, 6B and DSA 1 footprint. The AOC was further investigated as reported in the *Draft Supplemental Groundwater Data Report* (Weston 2005b).

7.3.6 The BERA concluded that, with few exceptions, there were no significant impacts to ecological receptors evaluated within estuarine environments located on the former Arsenal. Because conditions identified during this RI did not differ significantly from those identified during previous investigation work, additional ecological risk evaluation is not warranted for Areas 6, 6A, or 6B.

MEC Evaluation

8.0.1 The results of evaluations of Areas 6, 6A, 6B and DSA 1 using the *Risk Management Methodology at FUDS MMRP Projects* (USACE, 2017a) are presented below, along with the revised CSM. For ease of review, the corresponding tables are provided within this section.

8.1 MEC Risk Management Methodology

8.1.1 In accordance with the USACE Technical Memorandum *Trial Period for Risk Management Methodology at FUDS MMRP Projects* (USACE, 2017b), a risk assessment was performed to evaluate if there are acceptable or unacceptable human health risks due to potential MEC presence at Areas 6, 6A, 6B and DSA 1. The risk assessment was performed to satisfy the requirements of 40 CFR Section 300.175(d)(4).

8.1.2 The MEC Risk Management Methodology was applied to differentiate acceptable versus unacceptable site conditions. Using the site-specific CSM data, the risk assessment evaluated the likelihood of encounter, severity of encounter, and likelihood of detonation. This information was used to support the acceptable/unacceptable risk determination for a site. The risk assessment consists of four matrices:

- **Matrix 1** – Evaluates the likelihood of an MEC encounter based on access conditions and the amount of MEC.
- **Matrix 2** – Evaluates the severity of an incident based on the likelihood of encounter (determined in Matrix 1) and severity associated with unintentional detonation of the MEC items at the Site.
- **Matrix 3** – Evaluates the likelihood of detonation based on MEC sensitivity and the likelihood to impart energy on an item.
- **Matrix 4** – Identifies acceptable or unacceptable site conditions, based on the results from Matrix 2 and 3.

8.1.3 The MEC Risk Management Methodology considered site-specific current or reasonably anticipated future land use scenarios.

8.1.1 Likelihood of Encounter

8.1.1.1 Matrix 1, the likelihood of a MEC encounter (see Table 8-1), is based on the access conditions and amount of MEC present.

Table 8-1. Matrix 1 – Likelihood of Encounter*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

	Access Conditions (frequency of use)			
	Regular (e.g., daily use, open access)	Often (e.g., less regular or periodic use, some access)	Intermittent (e.g., some irregular use, or access limited)	Rare (e.g., very limited use, access prevented)
Likelihood of Encounter, Matrix 1: Amount of MEC vs. Access Conditions				
<ul style="list-style-type: none"> MEC is visible on the surface and detected in the subsurface. 	Frequent	Frequent	Likely	Occasional
<ul style="list-style-type: none"> The area is identified as a Concentrated Munitions Use Area (CMUA) where MEC is known or suspected (e.g., munitions debris [MD] indicative of MEC is identified) to be present in surface and subsurface. 	Frequent	Likely	Occasional	Seldom
<ul style="list-style-type: none"> MEC presence based on physical evidence (e.g., MD indicative of MEC), although the area is not a CMUA, or The MEC concentration is below a project-specific threshold to support this selection (e.g., less than 1.0/acre at 95 percent confidence). 	Likely	Occasional	Seldom	Unlikely
Amount of MEC <ul style="list-style-type: none"> MEC presence is based on isolated historical discoveries (e.g., explosive ordnance disposal [EOD] report) prior to investigation, or A Defense Environmental Restoration Program (DERP) response action has been conducted to physically remove MEC and known or suspected hazard remains to support this selection (e.g., surface removal where subsurface not addressed), or The MEC concentration is below a project-specific threshold to support this selection (e.g., less than 0.5/acre at 95 percent confidence). 	Occasional	Seldom	Unlikely	Unlikely
<ul style="list-style-type: none"> MEC presence is suspected based on historical evidence of munitions use only, or A DERP response action has been conducted to physically remove surface and subsurface MEC (evidence that some residual hazard remains to support this selection), or The MEC concentration is below a project-specific threshold to support this selection (e.g., less than 0.25/acre at 95 percent confidence). 	Seldom	Seldom	Unlikely	Unlikely
<ul style="list-style-type: none"> Investigation of the site did not identify evidence of MEC presence, or A DERP response action has been conducted that will achieve unlimited use and unrestricted exposure. 	Unlikely	Unlikely	Unlikely	Unlikely

8.1.1.1 Access Conditions

8.1.1.1.1 Access conditions are selected based on considerations of the access and frequency of use for the site. Areas 6, 6A, 6B and DSA 1 is owned by FBC, is currently undeveloped, and the majority of the site is densely vegetated wetland. Almost all of the land in Areas 6, 6A, and 6B is undeveloped marsh, with the exception of the demolished remnants of a sulfuric acid plant formerly located in Subarea 6A, currently a shipping facility parking lot. The property owner maintains several gates along the boundary, including a gate and a No Trespassing sign at the intersection of Riverside Drive and Cattail Way near the western end of Area 6B; a gate near the southeastern corner of Area 6; and gates near the southwestern corner of Area 6 (Figure 1-2). The property owner also maintains a chain link fence along the northern boundary of Area 6B and the DSA 2 surrounding areas, an No Trespassing Signs on all undeveloped properties, and a professional roving safety patrol that drives around the properties, main roads and undeveloped properties between 4 pm and 8 am Monday through Friday and weekend coverage from Friday at 4 pm to Monday at 8 am, 365 days a year. As shown in the graphical CSM (Figure 8-1), current potential receptors include maintenance and industrial/commercial workers as well as recreational users/trespassers. Future land use is not anticipated to change. However, if adjacent areas are developed in the future, Areas 6, 6A, 6B and DSA 1 could become more accessible than they currently are. Though not anticipated, future receptors were conservatively assumed to include construction/utility workers and residents. Based on the current and anticipated future land use and access conditions, the MEC risk assessment assumed “Rare” access (e.g., very limited use, access prevented) for all Areas 6, 6A, 6B and DSA 1.

8.1.1.2 Amount of MEC

8.1.1.2.1 Amount of MEC was determined using the previous investigation reports and RI characterization data. As discussed in Section 3, Site Characterization, multiple investigations have been conducted across Areas 6, 6A, 6B and DSA 1, and no MEC items have been discovered. Because historical data were not sufficient to evaluate the potential risk of MEC exposure within Areas 6, 6A, and DSA 1, DGM and intrusive investigation was performed in 2013/2014, and confirmed the absence of MEC at depth. A total of 318 point-source anomalies with unknown metallic sources that could potentially be MEC or MPPEH in the subsurface were identified along the DGM transects. Of these, a total of 205 locations were intrusively investigated comprised of 187 anomaly locations initially investigated plus 18 locations (not including the 3 underwater, 2 QC seeds, and 6 fence/backfill locations) investigated in May and June 2014 (Figure 5-1). MD was recovered from 6 anomaly locations (Figure 5-3), consisting of frag items and an empty grenade fuze. All items were certified as MDAS. The remainder of the anomaly sources at DSA 1 were non-munitions-related items (scrap metal and miscellaneous debris). Based on these results, the population of anomalies represented on the transects consists of 2.9 percent MD items and 97.1 percent non-munitions-related items. Results from the RI are consistent with previous work, such as the 1992 Phase I RI and the 1993 investigation, where only inert munitions related items were identified.

8.1.1.2.2 No MEC were identified during the intrusive investigation completed as part of this RI, and no constituents were identified in soil, sediment, or surface water that pose an unacceptable risk to human health or the environment. The likelihood of encountering MEC in Areas 6, 6A, 6B and DSA 1 is considered “Unlikely” (see Table 8-1).

8.1.2 Severity of Incident

8.1.2.1 Matrix 2, the severity of an unintentional MEC detonation (see Table 8-2), is based on the likelihood of encounter (discussed above) and the severity associated with specific munitions items.

Table 8-2. Matrix 2 – Severity of Incident*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

Severity of Explosive Incident, Matrix 2: Severity vs. Likelihood of Encounter		Likelihood of Encounter				
		Frequent (regular, or inevitable occurrences)	Likely (several or numerous occurrences)	Occasional (sporadic or intermittent occurrences)	Seldom (infrequent, rare occurrences)	Unlikely (not probable)
Severity Associated with Specific Munitions Items	Catastrophic/Critical: <i>May result in 1 or more deaths, permanent total or partial disability, or hospitalization</i>	A	A	B	B	D
	Modest: May result in 1 (or more) injury resulting in emergency medical treatment, without hospitalization	B	B	B	C	D
	Minor: May result in 1 or more injuries requiring first aid or medical treatment	B	C	C	C	D
	Improbable: No injury is anticipated	D	D	D	D	D

“A” indicates conditions most likely to result in determination of an unacceptable risk.

“D” indicates conditions most likely to result in determination of an acceptable risk.

8.1.2.1 Severity Associated with Specific Munitions Items

8.1.2.1.1 As identified in Section 4.1, Potential Source Areas, no MEC items have been identified at Areas 6, 6A, 6B and DSA 1 and explosives were not detected at elevated concentrations in soil, surface water, and sediment samples. However, based on the type of MD, the risk assessment assumed “catastrophic/critical (may result in 1 or more deaths, permanent total or partial disability, or hospitalization)” severity.

8.1.2.1.2 Given the Likelihood of Encounter (i.e., “Unlikely”) and Severity Associated with Specific Munitions Items (i.e., “catastrophic/critical”) factors, the Severity of Incident for Areas 6, 6A, 6B and DSA 1 is considered a “D.”

8.1.3 Likelihood of Detonation

8.1.3.1 Matrix 3, the likelihood of detonation (see Table 8-3), is based on the sensitivity of munitions items and the likelihood for energy to be imparted on an item.

Table 8-3. Matrix 3 – Likelihood of Detonation

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

		Likelihood to Impart Energy on an Item		
		High (e.g., areas planned for development, or seasonally tilled)	Modest (e.g., undeveloped, wildlife refuge, parks)	Inconsequential (e.g., not anticipated, prevented, mitigated)
Sensitivity Susceptibility to Detonation	Likelihood of Detonation, Matrix 3: Munitions Sensitivity vs. Likelihood of Energy to be Imparted			
	High (e.g., classified as sensitive)	1	1	3
	Moderate (e.g., high explosive or pyrotechnics)	1	2	3
	Low (e.g., propellant or bulk secondary explosives)	1	3	3
	Not Sensitive	2	3	3

8.1.3.1 Sensitivity

8.1.3.1.1 As discussed in Section 3, Site Characterization, no MEC items were identified at Areas 6, 6A, 6B, and explosives were not detected at elevated concentrations in soil, surface water, and sediment samples. However, based on the type of MD recovered, the sensitivity of MEC was selected as “High (e.g., classified as sensitive).”

8.1.3.2 Likelihood to Impart Energy

8.1.3.2.1 This factor takes into consideration the known activities at the site that may cause an interaction that results in energy being imparted on a munitions item by human activity. The current land use of Areas 6, 6A, 6B and DSA 1 is undeveloped. Future land use is anticipated to remain similar. Though development of nearby properties may occur in the future, the majority of the site is densely vegetated wetland. As such, and because no items have been previously encountered, the likelihood to impart energy on an item in Areas 6, 6A, 6B and DSA 1 was characterized as “Modest.”

8.1.3.2.2 Based on the selected Sensitivity and Likelihood to Impart Energy factors, the Likelihood of Detonation is considered a “1.”

8.1.4 Acceptable and Unacceptable Site Conditions

8.1.4.1 Matrix 4 (see Table 8-4) provides the overall risk for the site and differentiates “Acceptable” from “Unacceptable” conditions. The results from Matrices 2 and 3 are used to determine acceptable or unacceptable site conditions.

8.1.4.2 As discussed above, Matrix 2 (Severity of Incident) scored a “D” and Matrix 3 (Likelihood of Detonation) scored a “3.” As such, the risk assessment for Areas 6, 6A, 6B and DSA 1 is identified as “Acceptable” site conditions.

Table 8-4. Matrix 4 – Acceptable and Unacceptable Site Conditions*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

Acceptable and Unacceptable Site Conditions		Result from Matrix 2			
		A	B	C	D
Result from Matrix 3	1	Unacceptable	Unacceptable	Unacceptable	<u>Acceptable</u>
	2	Unacceptable	Unacceptable	Acceptable	Acceptable
	3	Unacceptable	Acceptable	Acceptable	Acceptable

Note: Multiple conditions may exist within a site, such that unique baselines risks can be established for the multiple explosive hazards that are present within the same property. Acceptable conditions indicate input factors are collectively determined to support a negligible risk. Project teams shall consider the nature of the specific item within the site and the probability to encounter to support the selection on the scale.

8.2 Risk Assessment Findings

8.2.1 As summarized in Table 8-5, the human health risk due to the possible presence of MEC for Areas 6, 6A, 6B and DSA 1 is determined to be “Acceptable,” and is recommended for NFA.

Table 8-5. MEC Risk Management Methodology Summary*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

Risk Management Matrix	Areas 6, 6A, 6B and DSA 1
Matrix 1	Unlikely
Matrix 2	D
Matrix 3	1
Matrix 4	D-1
Risk Determination	Acceptable

8.3 Revised Conceptual Site Model

8.3.1 A CSM describes the site and its environment, both natural and man-made, that is based on existing knowledge. It describes sources of MEC known or suspected to be present on the site, potential receptors, and the interactions that link them. The CSM illustrates the current and potential future exposure pathways based on the information provided in this RI. The components of the CSM are presented below.

8.3.2 The revised CSM for Area 6, 6A, 6B and DSA 1, based on review of historical documents and this RI is provided as Figure 8-1.

8.3.1 Nature and Extent of MEC (MEC Source)

8.3.1.1 Multiple investigations have been conducted across Areas 6, 6A, and 6B, and no MEC items have been discovered. No MEC were identified during the intrusive investigation completed as part of this RI, and no explosives or other munition constituents were identified in soil, sediment, or surface water that pose an unacceptable risk to human health or the environment. These findings indicate that Areas 6, 6A, and 6B and DSA 1 have a low likelihood of MEC, supported by the weight-of evidence evaluation detailed in Section 8.1.

8.3.2 Media of Concern (MEC Interaction)

8.3.2.1 No MEC were identified during previous investigations or the intrusive investigation completed as part of this RI. Based on the findings of the RI, MEC is no longer suspected to be present in site soils (surface or subsurface).

8.3.3 Potential Receptors

8.3.3.1 Potential receptors at Areas 6, 6A, 6B and DSA 1 include the following:

- **Maintenance Workers** – may be exposed to potential surface MEC (exposed to the surface via frost heave or erosion) when involved in building maintenance and to subsurface MEC while involved in landscaping
- **Industrial/Commercial Workers** – work primarily indoors and do not participate in intrusive activities but may have limited exposure to surface MEC (that is exposed to the surface via frost heave or erosion)
- **Recreational User/Trespasser** – may be exposed to surface MEC (exposed to the surface via frost heave or erosion) when recreating

8.3.3.2 Though not anticipated, future receptors are conservatively assumed to also include:

- **Construction/Utility Workers** – may be exposed to potential surface (exposed to the surface via frost heave or erosion) and subsurface MEC when performing construction or utility work that involves soil removal/excavation activities
- **Resident** – are assumed to have unlimited site access and therefore may be exposed to surface MEC (exposed to the surface via frost heave or erosion) and subsurface MEC

8.3.4 Summary of MEC Exposure Routes

8.3.4.1 Multiple investigations have been conducted across Areas 6, 6A, 6B and DSA 1, and no MEC items have been discovered. No MEC were identified during the intrusive investigation completed as part of this RI. Based on the results of the RMM, the human health risk due to the possible presence of MEC for Areas 6, 6A, 6B and DSA 1 is determined to be “Acceptable”. Consequently, the CSM (Figure 8-1) reflects incomplete MEC exposure pathways for all current and future receptors.

8.4 Remedial Investigation Findings

8.4.1 Based on the results of the MEC Risk Management Methodology and the revised CSM, the RI findings are as summarized in Table 8-6.

Table 8-6. Areas 6, 6A, 6B and DSA 1 Remedial Investigation Findings

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Site	Findings	Acreage
Areas 6, 6A, 6B and DSA 1	NFA FS not warranted	170

Summary and Conclusions

9.0.1 This RI focused on Areas 6, 6A, 6B and DSA 1 located along the east side of the former Arsenal. Subareas 6A and 6B were used as burning grounds for various ammunition components up to and including the former Arsenal closeout in 1963. DSA 1, which extends beneath the eastern side of Subarea 6 and all of Subarea 6A, was filled with dredge material from the Raritan River channel between approximately 1940 and 1956. The area is currently undeveloped marsh, with the exception of a shipping facility parking lot within Subarea 6A. Fieldwork presented in this RI includes an intrusive investigation of geophysical anomalies across previously unmapped portions of Subareas 6 and 6A and DSA 1. While no additional MC samples were collected as part of this RI, historical soil, sediment, and surface water samples were evaluated, and soil samples were collected from DSA 1 as part of a background study of the former Arsenal DSAs. No MEC were identified during the intrusive investigations. MD items were recovered from within the south-central side of DSA 1 and the southeastern side of Subarea 6. NFA is recommended for MEC, MC and HTW associated with Areas 6, 6A, 6B and DSA 1, based on an evaluation of the data previously collected and as presented in this RI and summarized below.

9.1 MEC Investigation Summary and Conclusions

9.1.1 The primary source of potential contamination at Areas 6, 6A, 6B and DSA 1 is MEC remaining from use of the former burning grounds and MEC munitions items contained in material dredged from the Raritan River and placed in DSA 1. MEC from the burning grounds would be distributed on the surface within Subareas 6A and 6B, and in the DSA would be randomly distributed throughout the land area at various depths within the subsurface or clustered within the subsurface. Areas 6, 6A, 6B and DSA 1 consist of predominantly undeveloped wetlands. The former burning grounds areas were cleared during closure of the former Arsenal and no MEC items have been discovered during historical investigations of the former burning grounds (Subareas 6A and 6B), former impoundments (Subarea 6) or resulting from placement of dredged spoils from the Raritan River (DSA 1). No MEC were identified during the historical intrusive investigations or during the more recent intrusive investigation completed as part of this RI. Results from the RI are consistent with previous work, such as the 1992 Phase I RI and the 1993 investigation, where only inert munitions related items were identified.

9.1.2 Potential exposure to explosive hazards due to the possible presence of MEC at Areas 6, 6A, 6B and DSA 1 was evaluated using the MEC Risk Management Methodology at Formerly Used Defense Sites. Using this methodology, the overall risk for the site was deemed acceptable, based on a combination of low likelihood of encountering MEC, low severity of unintentional MEC detonation, and modest likelihood to impart energy. The modified MEC CSM reflects incomplete MEC exposure pathways for all current and future receptors, and a recommendation of NFA for Areas 6, 6A, 6B and DSA 1 is proposed based on historical removal actions and the MEC Risk Management Methodology finding.

9.2 HTW Summary and Conclusions

9.2.1 Previous investigations at Areas 6, 6A, and 6B include a Contamination Evaluation, Phase I RI, Phase II RI, and BERA, and included sampling of surface and subsurface soil, sediment, and surface water. Evaluation of previous data indicate that levels of select PAHs and metals exceed RSLs and/or background concentrations in soil and sediment samples collected from Areas 6, 6A, and 6B; however, these constituents are generally widespread across these areas at similar concentrations and cannot be directly attributed to DoD-related activities or MEC source areas. No DoD-related COCs were identified

for soil, sediment, or surface water as part of this RI, and no risks were identified for ecological receptors.

9.2.2 The baseline HHRA conducted as part of this RI estimated the potential risks to human receptors associated with exposures to constituents detected in surface soil (0 to 2 feet bgs), subsurface soil (2 to 7.7 feet bgs), surface water, and sediment within Areas 6, 6A, 6B and DSA 1. The potential receptors evaluated in the HHRA included current/future maintenance workers and future recreational users/trespassers, industrial workers, construction workers, and hypothetical residents. Areas 6, 6A, 6B and DSA 1 will likely remain primarily undeveloped in the foreseeable future. However, a hypothetical residential scenario was included to evaluate the potential for an unrestricted land use scenario. A summary of the risk results for each potential receptor is provided in Table 6-4. The potential exposure pathways and risk results are discussed below:

- Current and future **maintenance workers** were assumed to be exposed to surface soil (0 to 2 feet bgs). The estimated cancer risks and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified for a current/future maintenance worker scenario.
- Future **recreational users/trespassers** (adult, adolescent, and child) were assumed to be exposed to surface soil (0 to 2 feet bgs), surface water, and sediment. The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified for a future recreational user/trespasser.
- Future **industrial/commercial workers** were assumed to be exposed to surface soil (0 to 2 feet bgs). The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified in surface soil for a future industrial/commercial scenario.
- Future **construction/utility workers** were assumed to be exposed to total soil (0 to 7.7 feet bgs). The estimated ELCRs and non-cancer HIs were within the acceptable risk criteria; therefore, no COCs attributable to a DoD release were identified in total soil for a future construction/utility worker scenario.
- Future **residents** (adult and child) were assumed to be exposed to surface soil (0 to 2 feet bgs) and total soil (0 to 7.7 feet bgs). The estimated ELCRs and non-cancer HIs exceeded the acceptable risk criteria for surface soil and/or total soil due primarily to arsenic. Arsenic was detected in site soil at concentrations attributable to background levels. As discussed in Section 3.5, a two-sample randomization (permutation) test was performed on the site soil and background data, and the results indicated that the arsenic concentrations in site soil were not statistically greater than the background concentrations (Table 3-11). After removing the background contributions for arsenic in site soil, the estimated ELCRs and HIs are within acceptable levels for a residential scenario. Therefore, no COCs attributable to a DoD release were identified in surface soil or total soil for a future residential scenario.

9.2.3 Overall, the HHRA indicated that after removing the background contributions for arsenic, potential exposures to site soil, sediment, and surface water at Areas 6, 6A, 6B and DSA 1 would result in estimated ELCRs less than the upper-end (1×10^{-4}) of EPA's acceptable risk range and estimated HIs less than the target organ HI of 1. Therefore, no COCs attributable to a DoD release were identified for Areas 6, 6A, 6B and DSA 1 based on the current and planned future land use for the site.

9.3 Conclusions

9.3.1 No MEC were identified during the historical intrusive investigations or during the intrusive investigation completed as part of this RI, and no DoD-related constituents were identified in soil,

sediment, or surface water that pose an unacceptable risk to current/future receptors. NFA is recommended for MEC, MC and HTW associated with Areas 6, 6A, 6B and DSA 1 based on an evaluation of the data previously collected and as presented in this RI.

Tables

Table 1-1. Areas of Investigation at the Former Raritan Arsenal*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

Area Name	Approximate Acreage	Description
Area 5	10 acres	Located in the central-eastern portion of the former Arsenal, this area consists of the Former Chemical/Mustard Disposal Area.
Areas 6, 6A, 6B, DSA 1, and Surrounding Areas	236 acres	Located in the southeastern portion of the former Arsenal, this area comprises the Former Burning Ground and Impoundment Areas, as well as an area of additional dredge deposits/spoils referred to as DSA 1.
Areas 9 and 19	350 acres	Located in the central-western portion of the former Arsenal, this area comprises Area 9 (Former Magazine H-65 Explosion Area) and Area 19 (Former Magazine Area).
Area 10	143 acres	Located on the western side of the former Arsenal, this area comprises the Former Wastewater Treatment and Magazine Area.
Area 11, DSA 2, and Surrounding Areas	130 acres	Located in the south-central portion of the former Arsenal, this area comprises the Former Dredged Material and Explosives Disposal Area, as well as an area of additional dredge deposits/spoils referred to as DSA 2.
Area 12, OB/OD, DSA 3, and Surrounding Areas	235 acres	Located in the southeastern portion of the former Arsenal, this area comprises the Former Dredged Material and Explosives Detonation Area, an area referred to as OB/OD, which presents the maximum “kickout” distances of munitions from former explosive detonation operations, and an area of additional dredge deposits/spoils beyond the boundary of Area 12 referred to as DSA 3.
Area 13	23 acres	Located in the south-central portion of the former Arsenal, this area comprises a thin strip of land alongside the dock, the Submerged Dock Area and approximately 17 acres of the Raritan River adjacent to the dock.
Areas 16 and 16A and Surrounding Areas	352 acres	Located in the southwestern portion of the former Arsenal, this area comprises the Former Magazine Area.
Area 18D, Middlesex Interfaith Partners and Beechwood Development	104 acres	Located in the northwestern portion of the former Arsenal, between Middlesex County College and the EPA/GSA Property, this area comprises the Trench of Shell Casings and the Beechwood Trench, a condominium complex referred to as Beechwood Development, and homeless shelter referred to as Middlesex Interfaith Partners.
DSAs 4 and 6	94 acres	DSAs 4 and 6 are located within the center of the Raritan River, south of the former Arsenal. These areas comprise discontinuous islands where it was speculated that dredge deposits/spoils were placed.
DSA 5	228 acres	DSA 5 is also located to the south of the former Arsenal, and comprises the maximum extent of area permissible to dispose of dredge deposits/spoils on the southern shore of the Raritan River, and comprises the “Spoils Area,” an 8-acre parcel of spoils.
EPA/GSA Property	178 acres	Located in the north-central portion of the former Arsenal, this area comprises Areas 1, 18A, 18B, 18C, 18E, 18F, and 18G.
Commercial/Industrial Area	1,233 acres	Located in the center of the former Arsenal, this area comprises Areas 2, 3, 4, 7, 8, 15, and 20, in addition to the Owens Illinois Area, Building 151, the Inland Container Corporation, and the area in the far north of the former Arsenal referred to as the Exclusion Area.

Table 1-1. Areas of Investigation at the Former Raritan Arsenal

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Area Name	Approximate Acreage	Description
Middlesex County College	169 acres	Located in the northwest corner of the former Arsenal, this area contains Areas 17, 17A, X, H, W, Building 118, and additional areas such as the High Traffic Area, UST removal areas, and the PCB Transformer Areas.
Total Area	3,485 acres	

Notes:

DSA = dredge spoil area

EPA = U.S. Environmental Protection Agency

GSA = General Services Administration

OB/OD = open burn/open detonation

PCB = polychlorinated biphenyl

UST = underground storage area

Table 1-2. Other Areas at the Former Raritan Arsenal

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Area Name	Approximate Acreage	Description
Capped Area 14 (Ineligible)	189 acres	Located in the eastern portion of the former Arsenal, this was former marshland and used for deposition of dredged material from the Raritan River. The land owner (FBC) obtained NJDEP approval to construct a large package distribution complex on this site, with the backfilling, building, pavement, and landscaping serving to cap soil contamination.
Army Reserve Center (Ineligible)	9 acres	Located to the west of the former Arsenal, these two non-contiguous areas are an active Army Reserve Center.
Total Area	198 acres	

Note:

NJDEP = New Jersey Department of Environmental Protection

Table 1-3. Investigations and Actions Completed for Areas 6, 6A, and 6B

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Date	Name of Investigation
1963	Surface Clearance and Disking to 6 Inches by LEAD (Dames & Moore, 1993b)
1988	Contamination Evaluation (O'Brien & Gere, 1989)
1992	Phase I RI (Dames & Moore, 1993a)
1993	Archival Search Report (Dames & Moore, 1993b)
1993	Geophysical Mapping and Sampling (EODT, 1993)
1994	Phase II RI (Weston, 1997)
2008	Baseline Ecological Risk Assessment

Notes:

LEAD = Letterkenny Army Depot

RI = remedial investigation

EODT = EOD Technology

SVOC = semivolatile organic compound

PCB = polychlorinated biphenyl

TNT - 2,4,6-trinitrotoluene

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxicity equivalence

^a Background soil values are the 95% upper tolerance limit (UTL) with 95% coverage (95/95 UTL) for the dredge spoil areas.

^b EPA's Regional Screening Levels (RSLs) for Soil to Groundwater Leachability (i.e., Soil Screening Levels [SSLs]). November 2018. <https://www.epa.gov/risk/regional-screening-levels-rsls>. If an RSL was not available for a constituent, the RSL for a surrogate chemical with structural and functional similarities was used.

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxicity equivalence

DAF = dilution attenuation factor

HCPCDD = heptachlorodibenzo-p-dioxin

PCB = polychlorinated biphenyl

SVOC = semivolatile organic compound

TNT = 2,4,6-trinitrotoluene

VOC = volatile organic compound

Notes:

Soil analytical data presented on this table include site and background samples collected from 0-10 feet bgs.

Bkgd = background

Conc. = concentrations

⁽¹⁾For data containing non-detect results, the Tarone-Ware two-sample test was utilized instead of the Wilcoxon Rank Sum test.

⁽²⁾For those metals whose data sets were log-transformed, test results based on the transformed data are presented.

Basis of Decision:

NP = nonparametric (Wilcoxon Rank Sum or Tarone-Ware tests)

perm = permutation test

Table 5-1. Dates of MEC Characterization Investigation

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Phase 1	Phase 2	Phase 3
December 11–12, 2013 (Initial Phase – DGM)	January 29 – February 7, 2014 (Initial Phase DGM)	MC sampling for background – August 26, 2016
February 17–25, 2014 (Remobilization for DGM)	May 22, 2014 (Remobilization for DGM)	

Table 5-2. Project Measurement Quality Objectives for Terrestrial DGM

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Measurement Quality Objective	Measurement Performance Criteria	Test Method	Results*
General System Function			
DGM Systems Positioning. Accurate positioning information is provided to DGM system.	The positional error of the system at known locations will not exceed 10 centimeters (4 inches).	Results of QC Test #2 (System Positioning) evaluated for compliance.	All positions were within 10 centimeters.
Repeatability. Repeatable and accurate data are being obtained from DGM system.	Response to ISO will not vary more than ± 20 percent from known response for specific distance from sensors in static tests conducted at the beginning and end of each survey day. Response of repeat line is comparable to original line data (qualitative determination).	Results of QC Test #5 (Static Background and Static Spike) evaluated quantitatively and compared to published response values for compliance.	All ISO responses were within the ± 20 percent from known responses for specific distances.
DGM Surveys			
Downline Data Density. Downline data density is sufficient to detect MEC items.	Over 98 percent of possible sensor readings are captured along a survey transect with a spacing of no greater than 0.2 meter (0.7 foot) between points. A data gap greater than 0.6 meter (2 feet) will not meet the MQO.	Results of DGM surveys quantitatively evaluated for compliance.	Average downline data density was achieved, with no readings greater than 0.61 meter apart.
Survey Coverage. Maintain appropriate line spacing to provide 100 percent coverage of accessible portions of the survey area.	Lane spacing for transect surveys will not vary greater than 20 percent from intended spacing unless vegetation, terrain or other obstructions cause the separation.	Results of DGM surveys quantitatively evaluated for compliance.	100 percent coverage with 1-meter footprint.
Dynamic Detection Repeatability.	Repeat data are comparable to original data. The number of anomalies on the repeat segment will be within 20 percent of the original data. Transect surveys: IVS anomaly characteristics (peak response and size) are repeatable within 25 percent.	At least 2 percent of the survey area repeated and evaluated for compliance.	All IVS amplitudes were repeatable within 25 percent for transect data sets and the number of anomalies was within 20 percent of the original data for comprehensive surveys
Dynamic Positioning Accuracy. Positioning of detected anomalies is accurate.	An anomaly will be identified within 1 meter of each blind seed item.	Results of DGM surveys evaluated to verify that all blind seeds have an anomaly location selected within this standard or can be otherwise explained.	All blind seeds were detected within 1-meter radius.

* See the Terrestrial Geophysical Report in Appendix D for further details of the test results.

Notes:

DGM = digital geophysical mapping

ISO = industry standard object

MEC = munitions and explosives of concern

MQO = measurement quality objective

QC = quality control

Table 5-3. DGM Instruments Standardization Tests and Acceptance Criteria

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Test	Test Description	Acceptance Criteria	Corrective Measure on Failure*	Power On	Beginning of Day	Beginning and End of Day	2% of Total Area Surveyed or Daily IVS
1	Equipment Warm-up	Equipment-specific (typically 10 minutes).	Re-collect data collected within 10-minute warm-up period.	X			
2	Record Sensor Positions (applicable only to those surveys for which GPS is used.)	±10 centimeters (4 inches) for RTK and 1 meter for sub-meter system.	Re-collect data from that test until test that passes criteria is completed.		X		
3	Personnel Test (applicable only to man-portable EM61-MK2 surveys)	Based on instrument used. Personnel, clothing, etc., should have no effect on instrument response.	Re-collect data from that test until test that passes criteria is completed.		X		
4	Cable Shake Test	Data profile does not exhibit data spikes.	Re-collect data from that test until test that passes criteria is completed.		X		
5	Static Background and Static Spike (applicable to EM61-MK2 surveys only)	±20 percent of standard item response, after background correction.	Re-collect data from that test until test that passes criteria is completed.			X	
6	Dynamic Detection Repeatability	(a) the number of anomalies on the repeat segment is within 20 percent of the original data, and (b) the test item (in IVS or transect data) anomaly characteristics (peak response and size) are repeatable within 25 percent (For transect EM61-MK2 surveys only [b] will apply.)	Re-collect data from that test until test that passes criteria is completed.				X

* No failures were experienced for the Areas 6 and 6A and DSA 1 investigation.

Table 6-1. Background Threshold Values for Soil*Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

CAS No.	Analyte	BTV* (mg/kg)
7429-90-5	Aluminum	25,325
7440-36-0	Antimony	5.401

7440-66-6	Zinc	709

* Background soil values are the 95/95 UTL for the DSAs.

Notes:

Refer to Appendix A for the DSA background sampling approach and derivation of the 95/95 UTLs.

BTV = background threshold value

DSA = Dredge Spoil Area

mg/kg = milligram(s) per kilogram

NA = not applicable

UTL = upper tolerance limit

Table 6-2. Constituents of Potential Concern

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Surface Soil (0 to 2 feet)	Subsurface Soil (2 to 7.7 feet)	Surface Water	Sediment
BEQ	BEQ	Aluminum	BEQ
2,3,7,8-TCDD TEQ	2,3,7,8-TCDD TEQ	Antimony	2,3,7,8-TCDD TEQ
Aluminum	Antimony	Arsenic	Aluminum
Antimony	Arsenic	Beryllium	Antimony
Arsenic	Cobalt	Cadmium	Arsenic
Cadmium	Iron	Cobalt	Cadmium
Cobalt	Vanadium	Copper	Cobalt
Iron	Heptachlor Epoxide	Iron	Iron
Manganese		Lead	Manganese
Mercury		Manganese	Mercury
Thallium		Nickel	Nickel
Vanadium		Selenium	Thallium
		Silver	Vanadium
		Thallium	Aroclor-1260
		Vanadium	4,4-DDD
		Zinc	
		Bis(2-ethylhexyl)phthalate	
		Trichloroethylene	

Notes:

BEQ = benzo(a)pyrene equivalent

2,3,7,8-TCDD = 2,3,7,8-tetrachlorodibenzo-p-dioxin

Table 6-3. Potentially Complete Exposure Pathways

Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Receptor	Medium	Exposure Route and Point of Exposure	Pathway Selected for Evaluation	Reason for Selection or Exclusion
Current/Future				
Maintenance worker	Surface soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site surface soil	Yes	Maintenance workers may contact site surface soil while working at the site.
Future				
Recreational user/trespasser (adult, adolescent, child)	Surface soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site surface soil	Yes	Recreational users/trespassers may contact site surface soil while visiting the site.
	Sediment	Ingestion and dermal contact exposure to COPCs in site sediment	Yes	Recreational users/trespassers may contact site sediment while visiting the site.
	Surface water	Ingestion and dermal contact exposure to COPCs in site surface water	Yes	Recreational users/trespassers may contact site surface water while visiting the site.
Industrial/commercial worker	Surface soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site surface soil	Yes	Industrial/commercial workers may contact site surface soil while working at the site.
Construction/utility worker	Total soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site total soil	Yes	Construction/utility workers may contact site total soil if the site is redeveloped in the future.
Hypothetical resident (adult and child)	Surface soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site surface soil	Yes	Although the site is unlikely to be considered for residential development, this scenario is included for decision-making purposes. Future residents could contact surface soil at the site.
	Total soil	Ingestion, dermal contact, and inhalation exposure to COPCs in site total soil	Yes	Although the site is unlikely to be considered for residential development, this scenario is included for decision-making purposes. Future residents could contact total soil at the site.

Note:

COPC = constituent of potential concern

Background Study for
Dredge Spoil Areas

Background Study for Dredge Spoil Areas

A background study was conducted for the dredge spoil areas (DSAs) that are being investigated as part of the remedial investigation/feasibility study (RI/FS) that is being completed for several areas of investigation¹ at the former Raritan Arsenal in Middlesex County, New Jersey (Figure A-1). The purpose of the background study was to collect samples representative of background conditions in the areas with dredge spoils and establish a background dataset using statistical and graphical data analyses.² Dredge spoils from the Raritan River were historically deposited at DSAs 1, 2, 3, 4, 5, and 6. Therefore, the background dataset for the dredge spoils will be used to determine if site concentrations within the DSAs are attributable to dredge spoils rather than a site-specific release.

The background study was conducted in general accordance with the following guidance documents:

- *Environmental Statistics: Environmental Quality – Engineering and Design* (U.S. Army Corps of Engineers [USACE], 2013)
- *Determination of Background Concentrations of Inorganics in Soils and Sediments at Hazardous Waste Sites* (U.S. Environmental Protection Agency [EPA], 1995)
- *Guidance for Comparing Background and Chemical Concentrations in Soil for CERCLA Sites* (EPA, 2002)
- *ProUCL Version 5.1 Technical Guide. Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations* (EPA, 2015)

The background study included the following steps: 1) Establishing a background dataset; 2) Estimating background threshold values (BTVs) using upper tolerance limits (UTLs); and 3) Providing the methodology for site-to-background comparisons. Each of these steps is discussed in the following sections.

Background Dataset

Background samples were collected from the DSAs and were evaluated to establish a representative background dataset for metals. The background dataset will be used in the site-to-background comparisons for the DSAs to determine if the metals are attributable to background levels. The approach used to collect the background data and the results of the background data evaluation are discussed below.

Background Data Collection

Overview of Dredge Spoil Areas

Historical records indicate that dredging of the lower Raritan River was performed from approximately the World War II era up to as recently as 1992. According to Weston (2002), “A 300-foot wide, 25-foot-deep channel was historically maintained by USACE from Raritan Bay upriver to immediately downstream of the former Arsenal.” Historical dredging activities maintained a turning basin, which vessels used for turning around in the channel after picking up supplies from the former Arsenal,

¹ The background study was conducted during RI/FS work performed as part of Contract Number W912DY-09-D-0060, Task Order 003.

² For the purpose of the study, “background” refers to concentrations or locations that are not influenced by a site-related release and are described as naturally occurring or anthropogenic.

whereas more recent dredging activities were focused on maintaining a channel downstream of the turning basin toward Raritan Bay.

The dredge spoils from the Raritan River were disposed within several areas identified as DSAs (Figure A-1) (Dames & Moore, 1993). The total land area of the DSAs is 645 acres with 323 acres located within the boundary of the former Arsenal and 322 acres located outside the boundary. The DSAs are located in the southeastern portion of the former Arsenal (DSA 1 through DSA 3), on the south shoreline of the Raritan River directly across from the former Arsenal (DSA 5), and on two small islands (Crab Island) located within the Raritan River (DSAs 4 and 6). DSA 1 overlaps with Areas 6, 6A, and 6B; DSA 2 overlaps with Area 11; and DSA 3 overlaps with Area 12.

Background Sampling Approach

The overall investigation approach used for the RI/FS for the former Raritan Arsenal consisted of three phases. Phases I and II were completed in Fall 2013 and Spring 2014, respectively, and consisted of digital geophysical mapping (DGM), selecting anomalies of interest, and conducting intrusive investigations of the selected anomalies. A statistically representative subset of the identified anomalies was investigated to determine which anomalies may represent targets of interest (either unexploded ordnance [UXO], discarded military munitions [DMM], or practice munitions items). The results of the Phase I and II investigations were used to determine the approach for the background sampling, as described in the *Final Revision 1 Uniform Federal Policy for Quality Assurance Project Plan (UFP-QAPP) for the RI/FS* (CH2M, 2016). The background sampling was completed during Phase III of the RI/FS in August 2016.

Sample locations for the background sampling were identified in areas where dredge spoils from the Raritan River were previously delineated; specifically at DSAs 1, 2, 3, and 5. The background sample locations were placed in separate DSAs to capture potential variability in constituent concentrations since the dredge spoils were sourced from different areas of the Raritan River and were dredged and deposited at different times. Within each DSA, the background samples were collected outside areas where metallic anomalies were identified to avoid areas potentially impacted by munitions and explosives of concern (MEC) and munitions constituents (MC).

The background samples were collected from random sample points located within two 0.5-acre sampling grids placed at each DSA. The sampling grids were subdivided into four cells and one sample location was randomly placed in each grid cell using the Environmental Systems Research Institute (ESRI) geographic information system (GIS) software. A total of 32 soil samples (0 to 10 feet below ground surface [bgs]) were collected and analyzed for Target Analyte List (TAL) metals. The samples were composited across the 0 to 10 feet depth interval. The soil sampling locations are shown on Figures A-2 through A-5.

Background Data Validation

The background analytical data collected from the DSAs during the Phase III sampling were validated, and the data validation results are provided in Attachment A-1. The validation process showed the precision, accuracy, representativeness, comparability and completeness of the laboratory results as qualified to meet the project objectives. A summary of the background data is provided in Table A-1. A copy of the background dataset is provided in Attachment A-2.

Background Data Evaluation

Identification of Outliers

An outlier can be defined as a measurement that is unusual relative to other measurements in the same sample population, and which therefore is suspected of misrepresenting the population to which it is

assigned (EPA, 2002). Because of their extreme value relative to most of the sample data, outliers can distort statistical calculations (EPA, 2002, 2015).

Typical reasons for outliers in background data (EPA, 2002) include:

- Improper sampling, analytical error, or laboratory contamination
- Errors in data transcription
- Non-normal population (population is highly skewed toward high or low values)
- Natural heterogeneity with “true” background values that are unusually low or high
- Sample is affected by site-related contamination

Background data collected from the DSAs were evaluated for potential outliers using the Rosner outlier test with a 0.05 significance level. The Rosner test was run up to five times and the potential outliers identified in each run were removed prior to running the subsequent test. The Rosner outlier test was also supplemented with graphical displays of the data (box-and-whisker plots and Q-Q plots) to facilitate the identification of potential outliers. The box-and-whisker plots and Q-Q plots are provided in Attachments A-3 and A-4, respectively. The potential outliers identified based on the Rosner test are summarized in Table A-2.

As stated in EPA’s *Data Quality Evaluation Statistical Toolbox (DataQUEST) User’s Guide* (EPA, 1997):

“If a data point is found to be an outlier, the analyst may either: 1) correct the data point; 2) discard the data point from analysis; or 3) use the data point in all analyses. This decision should be based on scientific reasoning in addition to the results of the statistical test. One should never discard an outlier based solely on a statistical test. Discarding an outlier from a data set should be done with extreme caution, particularly for environmental data sets, which often contain legitimate extreme values.”

The potential outliers identified based on the statistical tests and graphical displays are likely associated with the heterogeneity of the dredge spoils. The dredge spoils have inherent variability because they were collected from various areas of the Raritan River and were applied to the former Arsenal during different time periods. Additionally, the concentrations of metals in the dredge spoils reflect contributions from both naturally occurring and anthropogenic sources of uncertain origin. The background samples were not collected near metallic anomalies and therefore, are unlikely to represent a Department of Defense (DoD)-related release. The majority of the outliers were from four sample locations (DSA05-SB29, DSA05-SB30, DSA05-SB31, and DSA05-SB32) within the same sample grid located in the eastern portion of DSA 5. As shown in Figure A-5, these four locations were not located within close proximity to any metallic anomalies identified from the DGM. Based on these factors, the potential outliers identified based on the results of the statistical tests and graphical displays were included in the estimation of the UTLs for the DSAs.

Final Background Dataset

For the purpose of the background study, all of the background soil samples collected from DSAs 1, 2, 3, and 5 were grouped together to create one background data set. The dredge spoils were applied to the different DSAs at various times, in different quantities, and from multiple locations within the Raritan River. Therefore, combining the background data collected from the different DSAs provides a background dataset that is representative of the heterogeneity associated with the dredge spoils. The final background dataset consisted of all 32 soil samples (0 to 10 feet bgs) collected from DSAs 1, 2, 3, and 5.

Background Threshold Value Estimation

The 95 percent UTL of the 95th percentile, also called the 95/95 UTL or UTL, is typically used as a BTV for screening against site concentrations (EPA, 2015). If the background and site concentrations are not

different from one another, it can be concluded with 95 percent confidence that at least 95 percent of all site measurements will fall below the calculated 95/95 UTL (USACE, 2013). Therefore, it would be expected that a small percentage of site measurements will exceed the UTL, even when overall site contamination is not elevated relative to background. Based on this rationale, a target of 5 percent will be used to determine whether site concentrations are attributable to background levels.

The ProUCL software (EPA, 2016) was used to estimate the BTVs. The software estimates a value for non-detect results and tests the data distribution to determine if the data fit a normal, lognormal, or gamma distribution, or if the data do not fit any of these distributions (nonparametric). The UTL calculated based on ProUCL's recommended data distribution type was then selected as the BTV (Table A-3). The methods used by ProUCL software to estimate BTVs with non-detect results and to determine the distribution of the background dataset are briefly described below.

Handling of Non-detect Results

The occurrence of non-detect results (a left-censored data) is quite common in environmental datasets, especially when the data are from a background or reference area (EPA, 2015). The approach recommended by ProUCL (EPA, 2015) was used to calculate the UTLs for metals with non-detect results in the background data set. Goodness-of-fit tests for normal, lognormal and gamma distributions cannot be reliably used on left censored data. Therefore, emphasis is given on the use of distribution-free nonparametric methods including the Kaplan-Meier (KM), Chebyshev inequality, and other computer intensive bootstrap methods to calculate upper limits for datasets with non-detect results (EPA, 2015). The KM method has long been used in epidemiological statistics, such as survival analysis, to manage right-censored data. The KM method has been modified in ProUCL's algorithms to manage left-censored data.

Distributional Assumptions

The distribution of a dataset is important to determine so that appropriate statistical methods are used for analysis. The distributions of the background datasets for this study were determined using the ProUCL software (EPA, 2016). ProUCL uses two statistical tests to determine normal or log-normal distributions: the Shapiro-Wilk test and/or the Lilliefors test. ProUCL uses the Shapiro-Wilk test when the sample size is less than or equal to 50, and the Lilliefors test when the sample size is greater than 50. Tests for gamma distribution include the Kolmogorov Smirnov and Anderson-Darling tests. If ProUCL could not match the data to one of these three distributions, or if the percentage of non-detects in the dataset was greater than 40 percent (extreme left-censored data), nonparametric methods were used for further statistical analysis. Additional information regarding distributional tests is provided in the ProUCL guidance (EPA, 2015).

Recommended Methodology for Site-to-Background Comparisons

A site-to-background screening will be conducted for surface soil (0 to 2 feet bgs) and subsurface soil (2 to 10 feet bgs) at Areas 6, 6A, 6B (DSA 1); Area 11 (DSA 2); Area 12 (DSA 3); and DSAs 4, 5, and 6. The detected site concentrations of each metal will be compared to their respective BTVs to determine if more than 5 percent of the site concentrations exceed the BTVs. If more than 5 percent of the site concentrations for a particular metal exceed the BTV, this indicates the metal could be associated with site-specific contamination rather than background levels.

If a metal is identified as a risk driver based on the results of the risk assessment and 5 percent of its detected concentrations are greater than its respective BTV, additional statistical analyses may be performed to further compare site and background concentrations. Two-sample tests are often used to compare concentrations of two populations, such as site versus background (EPA, 2002; USACE, 2013).

EPA's ProUCL software will be used to run the two-sample tests. The two-sample hypotheses testing approaches in ProUCL are as follows (EPA, 2015) and will be selected for the comparison, as appropriate:

- Student t-test (with equal and unequal variances) – A parametric test that assumes normality
- Wilcoxon-Mann-Whitney test – A Nonparametric test that handles data with non-detects with one detection limit and assumes two populations have comparable shapes and variability
- Gehan test – A nonparametric test that handles data sets with non-detects and multiple detection limits and assumes comparable shapes and variability
- Tarone-Ware test – A nonparametric test that handles data sets with non-detects and multiple detection limits and assumes comparable shapes and variability.

The results of the statistical tests will be used as one line of evidence in determining if the site concentrations of detected metals are attributable to background levels. A qualitative component will also be included in the site-to-background comparisons and will involve identifying whether a particular metal is associated with munitions items and/or historical DoD activities. The results and conclusions of the site-to-background comparisons will be included in the RI Reports for Areas 6, 6A, 6B (DSA 1); Area 11 (DSA 2); Area 12 (DSA 3); and DSAs 4, 5, and 6.

Data Validation Summary

Raritan

TO: Mike Zamboni/WDC
Anita Dodson/VBO

FROM: Tiffany McGlynn/GNV

CC: Herb Kelly/GNV

DATE: October 21, 2016

Introduction

The following data validation report discusses the data validation process and findings for Empirical Laboratories, for Sample Delivery Group (SDG) 1608229.

Samples were analyzed using the following analytical methods:

- SW6010C Metals
- SW7471B Mercury

The samples included in this SDG are listed in the table below.

Sample Name	Matrix
DSA03-SB17-0010	Soil
DSA03-SB18-0010	Soil
DSA03-SB19-0010	Soil
DSA03-SB20-0010	Soil
DSA03-SB21-0010	Soil
DSA03-SB22-0010	Soil
DSA03-SB23-0010	Soil
DSA03-SB24-0010	Soil
DSA05-SB25-0010	Soil
DSA05-SB26-0010	Soil
DSA05-SB27-0010	Soil
DSA05-SB28-0010	Soil

Data Evaluation

Data was evaluated in accordance with the analytical methods and with the criteria found in the following guidance documents: Uniform Federal Policy- Quality Assurance Project Plan Addendum for the Remedial Investigation/Feasibility Study Military Munitions Response Program Former Raritan Arsenal Edison, New Jersey CTO 003 (August 2016) and National Functional Guidelines for Superfund Organic Methods Data Review (August 2014), as applicable. The samples were evaluated based on the following criteria:

- Data Completeness
- Technical Holding Times
- Instrument Tuning
- Initial/Continuing Calibrations
- Blanks
- Internal Standards
- Laboratory Control Samples
- Matrix Spike Recoveries
- Serial Dilution
- Interference Check Sample
- Identification/Quantitation
- Reporting Limits

Overall Evaluation of Data/Potential Usability Issues

Specific details regarding qualification of the data are addressed in the sections below. If an issue is not addressed there were no actions required based on unmet quality criteria. When more than one qualifier is associated with a compound/analyte, the validator has chosen the qualifier that best indicates possible bias in the results and qualified these data accordingly.

Data Completeness

The SDG was received complete and intact.

Technical Holding Times

According to the chain of custody records, sampling was performed on 8/22/16 and 8/23/16. Samples were received at the laboratory on 8/24/16. All sample preparation analysis was performed within holding time requirements.

Calibration

Vanadium exhibited high responses in the continuing calibration. Affected data are summarized in the table below.

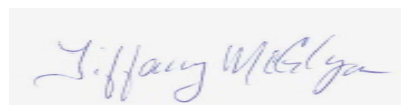

Sample ID	Compound	Q Flag	Qual Code
DSA03-SB17-0010	Vanadium	J+	CCH
DSA03-SB18-0010	Vanadium	J+	CCH
DSA03-SB19-0010	Vanadium	J+	CCH
DSA03-SB20-0010	Vanadium	J+	CCH
DSA03-SB21-0010	Vanadium	J+	CCH
DSA03-SB22-0010	Vanadium	J+	CCH
DSA03-SB23-0010	Vanadium	J+	CCH
DSA03-SB24-0010	Vanadium	J+	CCH
DSA05-SB25-0010	Vanadium	J+	CCH
DSA05-SB26-0010	Vanadium	J+	CCH
DSA05-SB27-0010	Vanadium	J+	CCH
DSA05-SB27-0010	Vanadium	J+	CCH
DSA05-SB28-0010	Vanadium	J+	CCH

Conclusion

These data can be used in the project decision-making process as qualified by the data quality evaluation process.

Please do not hesitate to contact us about this validation report.

Sincerely,

A handwritten signature in blue ink, reading "Tiffany McGlynn", is displayed within a light gray rectangular box.

Tiffany McGlynn

Qualification Flags

Exclude	More appropriate data exist for this analyte.
R	Data were rejected for use.
UL	Analyte not detected, quantitation limit is potentially biased low.
UJ	Analyte not detected, estimated quantitation limit.
U	Analyte not detected.
B	Not detected substantially above the level reported in laboratory or field blanks.
L	Analyte present, estimated value potentially biased low.
K	Analyte present, estimated value potentially biased high.
N	Analyte identification presumptive; no second column analysis performed or GC/MS tentative identification.
J	Analyte present, estimated value.
NJ	Analysis indicates the presence of an analyte that was "tentatively identified" and the associated value represents its approximate concentration.
None	Placeholder for calculating quality control issues that do not require flagging.
=	Analyte was detected at a concentration greater than the quantitation limit.

Qualifier Code Reference

Value	Description
%SOL	High Moisture content
2C	Second Column – Poor Dual Column Reproducibility
2S	Second Source – Bad reproducibility between tandem detectors

Q-Q Plot for Aluminum Concentration (mg/kg)

Reported values used for nondetects

Aluminum Concentration (mg/kg)

Total Number of Data = 32
 Number of Non-Detects = 0
 Number of Detects = 32
 Detected Mean = 16704
 Detected Sd = 7051
 Slope (displayed data) = 6791
 Intercept (displayed data) = 16704
 Correlation, R = 0.938

☒ Best Fit Line

Q-Q Plot for Antimony Concentration (mg/kg) Reported values used for nondetects

**Antimony Concentration (mg/kg)**

Total Number of Data = 32

Number of Non-Detects = 27

Number of Detects = 5

Detected Mean = 4.494

Detected Sd = 3.343

Slope (displayed data) = 2.02

Intercept (displayed data) = 2.791

Correlation, R = 0.914

☒ Best Fit Line

Q-Q Plot for Arsenic Concentration (mg/kg)

Reported values used for nondetects

Arsenic Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 29.51

Detected Sd = 46.21

Slope (displayed data) = 35.56

Intercept (displayed data) = 29.51

Correlation, R = 0.75

☒ Best Fit Line

Q-Q Plot for Barium Concentration (mg/kg)

Reported values used for nondetects

Barium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 43.9

Detected Sd = 46.68

Slope (displayed data) = 40.47

Intercept (displayed data) = 43.9

Correlation, R = 0.845

☒ Best Fit Line

Q-Q Plot for Beryllium Concentration (mg/kg) Reported values used for nondetects

**Beryllium Concentration (mg/kg)**

Total Number of Data = 32

Number of Non-Detects = 1

Number of Detects = 31

Detected Mean = 0.885

Detected Sd = 0.349

Slope (displayed data) = 0.372

Intercept (displayed data) = 0.91

Correlation, R = 0.98

☒ Best Fit Line

Q-Q Plot for Cadmium Concentration (mg/kg)

Reported values used for nondetects

Cadmium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 28

Number of Detects = 4

Detected Mean = 3.266

Detected Sd = 2.558

Slope (displayed data) = 0.96

Intercept (displayed data) = 0.941

Correlation, R = 0.74

☒ Best Fit Line

Q-Q Plot for Calcium Concentration (mg/kg) Reported values used for nondetects

Calcium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 1637

Detected Sd = 1467

Slope (displayed data) = 1410

Intercept (displayed data)= 1637

Correlation, R = 0.936

☒ Best Fit Line

Q-Q Plot for Chromium Concentration (mg/kg)

Reported values used for nondetects

Chromium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 51.67

Detected Sd = 53.75

Slope (displayed data) = 44.26

Intercept (displayed data) = 51.67

Correlation, R = 0.802

☒ Best Fit Line

Q-Q Plot for Cobalt Concentration (mg/kg) Reported values used for nondetects

Cobalt Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 9.6

Detected Sd = 4.339

Slope (displayed data) = 4.375

Intercept (displayed data) = 9.6

Correlation, R = 0.982

☒ Best Fit Line

Q-Q Plot for Copper Concentration (mg/kg) Reported values used for nondetects

Copper Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 73.14

Detected Sd = 162.1

Slope (displayed data) = 110.8

Intercept (displayed data) = 73.14

Correlation, R = 0.666

☒ Best Fit Line

Q-Q Plot for Iron Concentration (mg/kg) Reported values used for nondetects

Iron Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 36133

Detected Sd = 14118

Slope (displayed data) = 14165

Intercept (displayed data) = 36133

Correlation, R = 0.977

☒ Best Fit Line

Q-Q Plot for Lead Concentration (mg/kg) Reported values used for nondetects

Lead Concentration (mg/kg)
Total Number of Data = 32
Number of Non-Detects = 0
Number of Detects = 32
Detected Mean = 49.05
Detected Sd = 90.57
Slope (displayed data) = 66.08
Intercept (displayed data) = 49.05
Correlation, R = 0.711

☒ Best Fit Line

Q-Q Plot for Magnesium Concentration (mg/kg)

Reported values used for nondetects

Magnesium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 5463

Detected Sd = 2586

Slope (displayed data) = 2586

Intercept (displayed data) = 5463

Correlation, R = 0.974

☒ Best Fit Line

Q-Q Plot for Manganese Concentration (mg/kg) Reported values used for nondetects

Manganese Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 228.1

Detected Sd = 168.6

Slope (displayed data) = 154.6

Intercept (displayed data)= 228.1

Correlation, R = 0.894

☒ Best Fit Line

Q-Q Plot for Mercury Concentration (mg/kg)

Reported values used for nondetects

Mercury Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 24

Number of Detects = 8

Detected Mean = 2.146

Detected Sd = 2.198

Slope (displayed data) = 0.948

Intercept (displayed data) = 0.575

Correlation, R = 0.663

☒ Best Fit Line

Q-Q Plot for Molybdenum Concentration (mg/kg)

Reported values used for nondetects

Molybdenum Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 7

Number of Detects = 25

Detected Mean = 3.951

Detected Sd = 3.176

Slope (displayed data) = 2.79

Intercept (displayed data) = 3.507

Correlation, R = 0.911

☒ Best Fit Line

Q-Q Plot for Nickel Concentration (mg/kg)

Reported values used for nondetects

Nickel Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 23.65

Detected Sd = 12.9

Slope (displayed data) = 12.85

Intercept (displayed data) = 23.65

Correlation, R = 0.971

Q-Q Plot for Potassium Concentration (mg/kg)

Reported values used for nondetects

Potassium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 3159

Detected Sd = 1519

Slope (displayed data) = 1485

Intercept (displayed data) = 3159

Correlation, R = 0.952

Best Fit Line

Q-Q Plot for Selenium Concentration (mg/kg)

Reported values used for nondetects

Selenium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 23

Number of Detects = 9

Detected Mean = 5.251

Detected Sd = 5.594

Slope (displayed data) = 2.749

Intercept (displayed data) = 2.624

Correlation, R = 0.781

☒ Best Fit Line

Q-Q Plot for Silver Concentration (mg/kg) Reported values used for nondetects

Silver Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 27

Number of Detects = 5

Detected Mean = 6.326

Detected Sd = 3.165

Slope (displayed data) = 1.852

Intercept (displayed data) = 1.51

Correlation, R = 0.743

☒ Best Fit Line

Q-Q Plot for Sodium Concentration (mg/kg)

Reported values used for nondetects

Sodium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 5355

Detected Sd = 7469

Slope (displayed data) = 6266

Intercept (displayed data) = 5355

Correlation, R = 0.817

☒ Best Fit Line

Q-Q Plot for Thallium Concentration (mg/kg)

Reported values used for nondetects

Thallium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 23

Number of Detects = 9

Detected Mean = 0.704

Detected Sd = 0.286

Slope (displayed data) = 0.782

Intercept (displayed data) = 1.176

Correlation, R = 0.914

☒ Best Fit Line

Q-Q Plot for Vanadium Concentration (mg/kg) Reported values used for nondetects

Vanadium Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 49.45

Detected Sd = 26.49

Slope (displayed data) = 25.28

Intercept (displayed data) = 49.45

Correlation, R = 0.929

☒ Best Fit Line

Q-Q Plot for Zinc Concentration (mg/kg)

Reported values used for nondetects

Zinc Concentration (mg/kg)

Total Number of Data = 32

Number of Non-Detects = 0

Number of Detects = 32

Detected Mean = 109.2

Detected Sd = 144.3

Slope (displayed data) = 107.3

Intercept (displayed data) = 109.2

Correlation, R = 0.724

☒ Best Fit Line
