

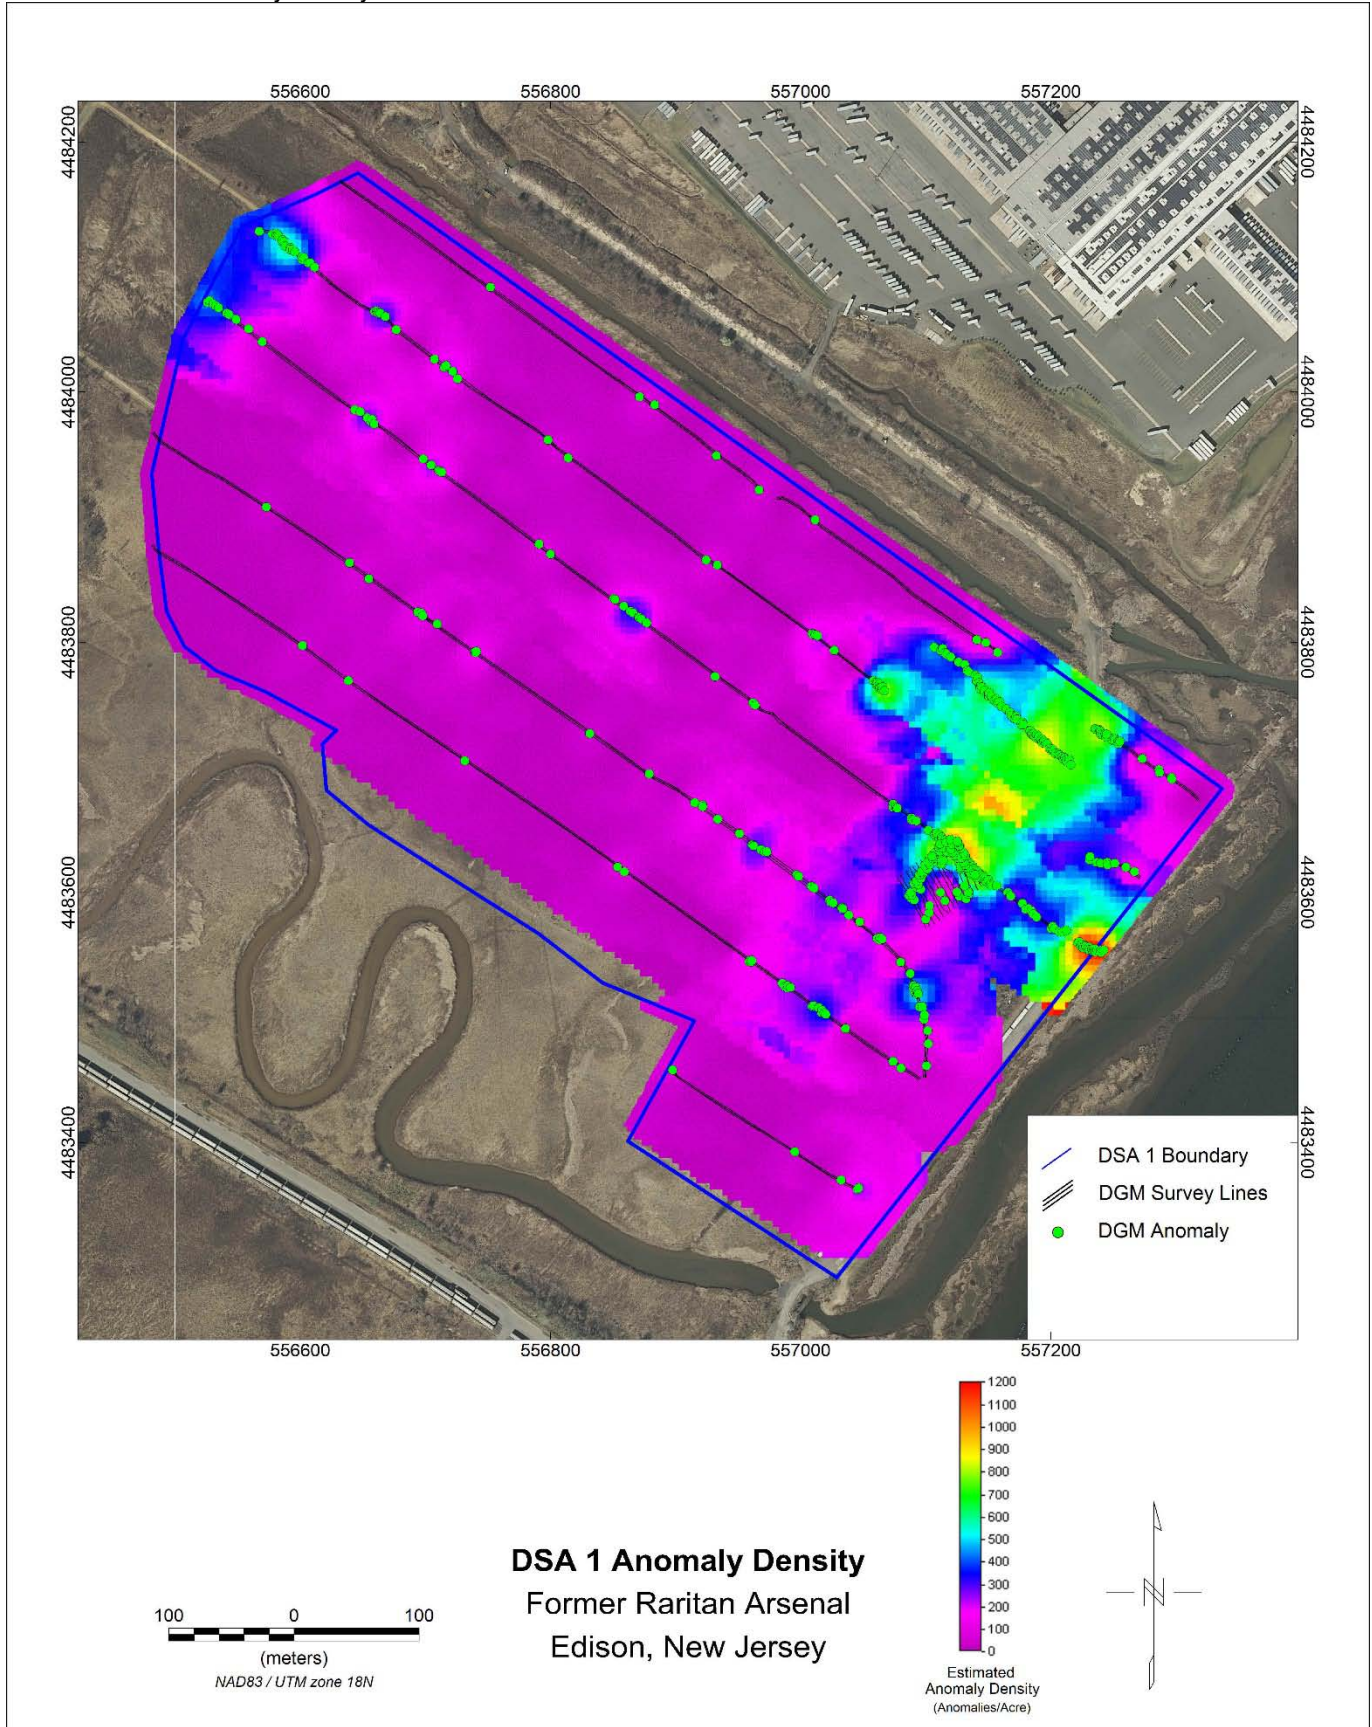

FIGURE 2
DSA 1 Estimated Anomaly Density

Statistical Selection of DGM Anomalies for Intrusive Investigation

To determine if the identified DGM anomalies are related to munitions items, a statistically representative subset of the identified anomalies must be intrusively investigated. The Estimating a Proportion method, described below, was used to calculate the number of randomly selected DGM anomalies that should be intrusively excavated to estimate, with a 95 percent confidence level and ± 5 percent sampling error, the proportion of munitions-related to non-munitions-related items within the population of anomalies detected along the DGM transects.

Estimating a Proportion Method

When a population size is large or unknown, the necessary sample size of DGM anomalies to be intrusively investigated can be estimated using the following statistical sample size formula:

$$n_0 = \frac{Z_{\alpha}^2 pq}{e^2}$$

Z_{α}	=	desired confidence level
p	=	proportion of DGM anomalies classified as munitions-related
q	=	proportion of DGM anomalies classified as non-munitions-related ($q = 1-p$)
e	=	acceptable margin of error for proportion being estimated
n_0	=	statistical sample size for a large population

To conservatively estimate the variance of proportional variables (i.e., munitions-related or non-munitions-related), pq (in the equation above), a population proportion of 50 percent ($p=0.5$) was estimated to maximize the variance, and subsequently maximize the sample size. Using a z-statistic for a 95 percent confidence level ($Z_{\alpha}=1.96$) and a margin of error of 5 percent ($e=0.05$), the solution for n_0 becomes:

$$n_0 = \frac{Z_{\alpha}^2 pq}{e^2} = \frac{1.96^2 (0.5)(0.5)}{0.05^2} = 384$$

A maximum of 384 randomly selected DGM anomalies was estimated for classifying, with 95 percent confidence level and ± 5 percent sampling error, the proportion of munitions-related to non-munitions-related DGM anomalies in a large or unknown population.

Following the estimation of the population size above, the following finite (known) population correction was used to reduce the number of anomalies required to obtain the same confidence level:

$$n_1 = \frac{n_0}{1 + \left(\frac{n_0}{N} \right)}$$

n_1 = adjusted statistical sample size for a finite population
 n_0 = statistical sample size for a large population
 N = size of the population (number of DGM anomalies)

The results of this calculation for various population sizes at a 95 percent confidence level are shown on [Figure 3](#).

FIGURE 3
Estimating a Proportion Sample Size

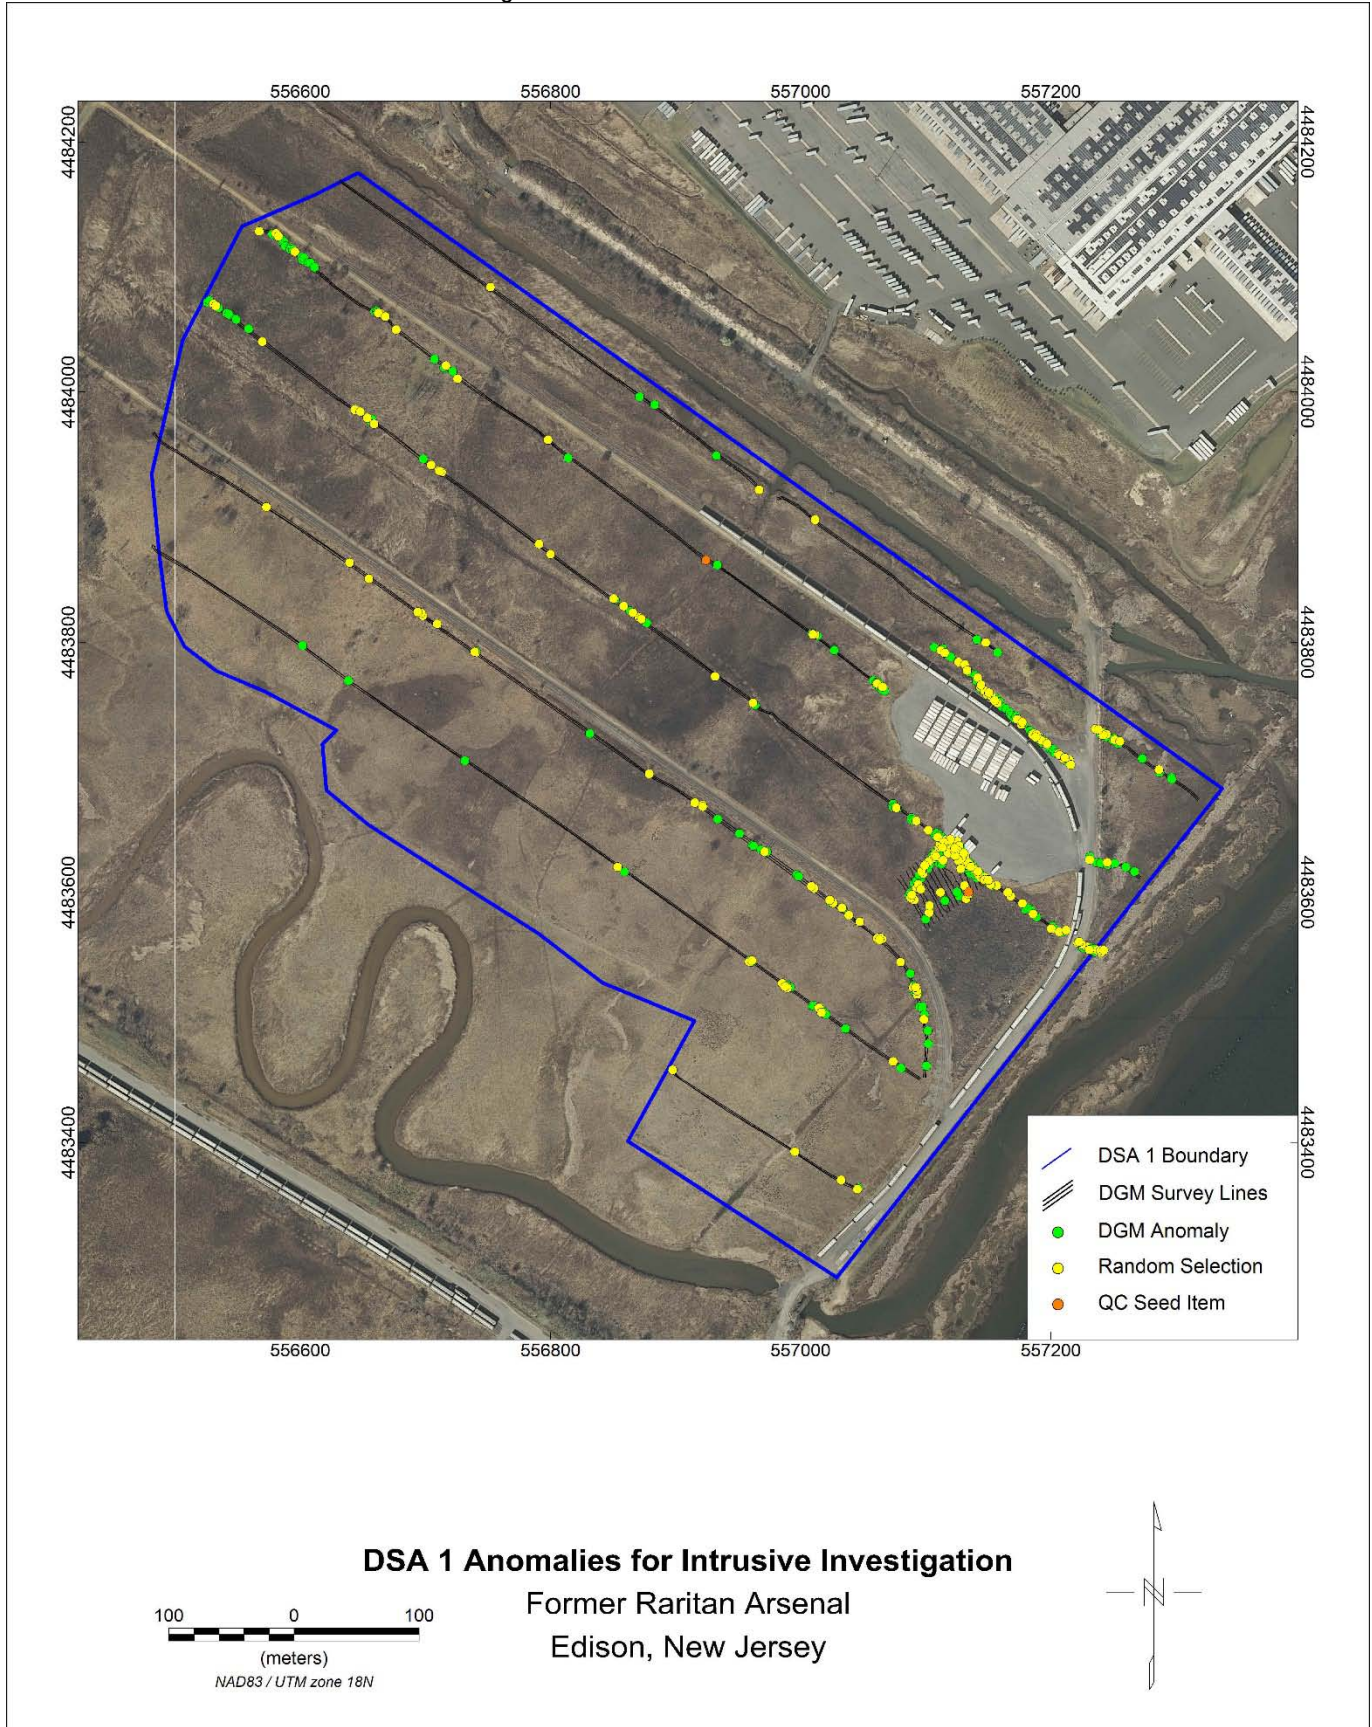

The finite population correction equation used a random number selector process and excluded the anomaly related to the QC seed item. This means that of the 441 anomalies identified along the DGM transects, 439 anomalies were used as the population size ("N" in the equation) to calculate the finite population correction:

$$n_1 = \frac{n_0}{1 + \left(\frac{n_0}{N}\right)} = \frac{384}{1 + \frac{384}{439}} = 204.83$$

The result shows that intrusively investigating 205 anomalies will provide a statistically-derived estimate of the distribution of munitions-related to non-munitions-related items present among the anomalies identified along the DGM transects at 95 percent confidence level and within ± 5 percent sampling error. Adding in the anomalies related to the QC seed items resulted in a total of 207 anomalies for intrusive investigation. The randomly-selected anomalies are shown on [Figure 4](#).

FIGURE 4
DSA 1 Anomalies Selected for Intrusive Investigation

Conclusion

A total of 439 anomalies potentially representing MEC/MPPEH were identified from the DGM survey along the transects at DSA 1. To determine if the DGM anomalies are related to munitions items, a statistically representative subset of the identified anomalies must be intrusively investigated. Based on the statistical assessment performed, 205 of the 439 anomalies should be intrusively investigated to confirm if the anomalies are related to MEC/MPPEH. With the addition of 2 anomalies related to QC seed items, a total of 207 anomalies have been proposed for intrusive investigation. The unique anomaly identification coordinates, and amplitude of each anomaly selected for intrusive investigation is presented as [Attachment A](#).

Form 4-12 NONCONFORMANCE REPORT

PROJECT:	NCR No.	Date: 02/12/14
To: NAEVA	001	Page 1
ORIGINAL—Please return to CH2M HILL		
Item: Noise in geophysical data provided by CH2M HILL Subcontractor, NAEVA Geophysics		
Work Plan Reference : GIP (Appendix F of Work Plan) and QC documentation in MRSIMS. Requirement: Subcontractor is to review their data and ensure that all QC tests have been performed and passed and the data quality is acceptable.		
Nonconformance: Subcontractor failed to compare AM and PM Instrument Verification Strip tests and notice that their towed array system was exhibiting noise in some of the surveys. This indicator should have prompted them to understand that their system had an intrinsic noise issue and led them to investigate the quality of the data being collected. A review of the data from the transects collected across the site using the towed array system shows similar noise to that shown in the IVS. All of the towed array data are of questionable quality and must be recollected. Some of the data may be usable for the objectives of particular areas but repeated data collection is required to evaluate this possibility. It is unclear from the existing IVS data and transects data where the system was functioning appropriately.

RE: Failure to Identify Intrinsic Noise in the Towed Array system

Event Description

On February 7th NAEVA was notified by email that Grid Block TDSA3-13 had a significant number of no contacts during the intrusive operations and these no contacts were targets selected on suspected noise. After further review by CH2M HILL's Principal Technologist, it was determined that all of the data collected by the towed array system was questionable based on noise exhibited in the IVS tests on the 11th, 12th and 17th of December and similar noise was also noticed in a significant number of the transects. Some of the data appears to be valid, however repeated data collection is needed to confirm.

Root Causes

Two root causes and two causal factors led to the failure to identify the intrinsic noise in the towed array.

The first root cause and causal factor led to the towed array system becoming noisy. The root cause was due to site conditions (canals, marshy areas, weather (rain and snow)) contributing to the system being routinely submerged in water. The system being submerge repeatedly in water led to the causal factor of water getting into the coils producing system noise.

The second root cause and causal factor led to the failure to notice that the towed array was producing noise intrinsic to the system. The root cause was that the field crew, processors, and QC made assumptions about the cause of the noise in the data based on site conditions (urban, utilities, industrial) that could justify the noise in the data. Clearly these assumptions should not have been made without further onsite documentation. These assumptions led to the causal factor of not identifying that the noise was intrinsic to the system.

Corrective Actions

All towed array data is to be recollected after modification have been made to the system in an effort to keep water from infiltrating and causing noise.

VIRGINIA
P.O. Box 7325
Charlottesville
Virginia 22906
(434) 978-3187
(434) 973-9791 Fax

Below lists the modification that have been made to the system prior to remobilization:

- In addition to the use of the encapsulated EM61-MK2A coils, all vulnerable ports were additionally waterproofed using shrink wrap and Silicone.

- The Silicone was coated over a 'dummy-plug' inserted in the Odometer port, as well as over the cable connections. This makes the coil-cable connection semi-permanent and it will remain as such for the duration of the project to help ensure waterproof results.

To help ensure that the data is being interpreted properly all personnel involved in the data collection, processing, and QC have met jointly to review the noisy data that was collected previously at Raritan. Further, it has been made clear by management that if anyone has questions regarding the validity of data it should to be brought to the immediate attention of QC.

Additionally, given the extreme site conditions at Raritan, more frequent QC tests will be conducted throughout the day to help ensure an entire day's of data is not collected if a problem arises with the system. These additional tests will include:

- A mid-day or at any time the system is broken down for movement to another area, a static test will be conducted.
- Since the IVS is not convenient to the site locations to be collected midday, an area near each data collection site will be used as a test strip. Either an item will be placed on the surface or an area with a known response will be collected before, mid-day and/or after each survey. This will be repeated if the system is broken down and moved to another collection site within the same day.

During the mid-day break, all collected data will be sent to the office for immediate review.

Recommended Corrective Action for Future Work

To help ensure that this issue does not arise again, the following corrective actions are recommended:

- QC will provide a more comprehensive review of all data.
- At any time significant noise is identified in the data, additionally onsite testing will occur to help isolate the source of the noise.
- Management will ensure that all collected data will be more thoroughly scrutinized by all parties (Field, Processing and QC).

TECHNICAL MEMORANDUM

Digital Geophysical Mapping Re-Surveys, Combined Analysis of Original and Re-Surveyed Data, and Path Forward, Former Raritan Arsenal, Edison, New Jersey

ATTACHMENTS: Anomalies Selected for Intrusive Investigation

Introduction

This technical memorandum presents the results of the digital geophysical mapping (DGM) survey data from the re-surveys performed after discovery that the EM61-MK2 towed array used by CH2M HILL's subcontractor had some intrinsic system noise that affected anomaly selections in the low amplitude range. As a result of the resurveys, new anomaly selections were made in each of the following areas:

- Area 12
- Dredge Spoils Area 1 (DSA1)
- DSA2
- DSA3
- DSA5

Because a subset of the originally selected anomalies in these areas had already been subjected to either intrusive investigation or advanced electromagnetic induction (EMI) system (TEMTADS 2x2) cued interrogation, a combined analysis needed to be performed on the data sets to determine the quantity and locations of anomalies still needed to be intrusively investigated to achieve the 95% confidence in the makeup of the population of anomalies along the surveyed transects in each of the areas.

A summary of the resurvey activities and the approach and results of the combined analysis are presented herein.

Digital Geophysical Mapping Resurveys

After discovering that some intrinsic system noise was evident in the data set that affected anomaly selections in the low amplitude range and a root cause analysis (RCA), all of the towed array data were recollected between February and March, 2014. A detailed description of all activities in support of the DGM survey will be presented in a Remedial Investigation report to be prepared after the anomaly intrusive investigation. The DGM was conducted using a vehicular towed array system consisting of 3 EM61-MK2 time domain electromagnetic induction detector coils mounted side by side and towed behind an ARGO utility task vehicle along transects nominally spaced at 80 meter intervals. Results of the resurveys, including data and figures, were provided to USACE in data deliverable packages.

Combined Analysis Approach

The approach to the combined analysis was as follows:

1. Determined quantity of original anomalies selected (randomly) for investigation that could be used in characterization effort
 - Started with total anomalies investigated (or that were interrogated with TEMTADS)
 - Removed all No Contacts
 - Removed all ‘Underwater’
 - Removed all QC Seeds dug
 - Removed all ‘other’ (e.g. survey stake, road, parking lot, etc.)
 - Removed TEMTADS investigated anomalies that had ‘No Find’ results (no signal in TEMTADS)
 - Resulting number was the quantity of randomly selected anomalies from the first data set that were real anomalies caused by metal as opposed to noise by the system.
2. Calculated total quantity of anomalies between both data sets (newly detected anomalies¹ + anomalies that had their sources removed during intrusive investigation) to determine TOTAL real anomalies in the area for statistical calculations
3. Determined quantity of randomly selected anomalies requiring investigation to achieve 95% confidence in makeup of anomaly population along transects in area using the Estimating a Proportion statistical technique described in the project work plan (CH2M HILL, 2013)
4. Subtracted quantity determined in #1 (real anomalies investigated in initial investigation effort) from #3 to determine quantity of additional (randomly selected) anomalies needing investigation

Combined Analysis Results and Path Forward

[Table 1](#) shows results of the combined analysis. In total, 183 anomalies (which includes 11 QC seed locations) remain to be investigated across the transects surveyed with the EM61-MK2 towed array to achieve the 95% confidence in the makeup of the population of anomalies along the surveyed transects in each of the areas. The quantity of anomalies determined for each individual area requiring additional digs beyond just recovery of QC seeds have been randomly selected (except the QC seeds which are selected for intrusive investigation regardless) and are provided in Microsoft Excel tables with this document. [Attachment A](#) provides the tabulated results of anomalies selected for intrusive investigation. [Attachment B](#) provides figures of the locations of anomalies selected for intrusive investigation.

¹ Included Types 1 (point source anomaly), 3 (suspected culture [requested to be investigated by USACE geophysicist]), 6 (anomaly selected below established threshold [appears to be metallic item]) and 12 (selected based on both 2013 and 2014 data [i.e. present in both data sets even though below threshold in one])

Table 1. Results of combined analysis of anomaly selections from the original towed array surveys and the resurveys

Area/Description	Area 12	DSA #1	DSA #2	DSA #3	DSA #5	Total
Initially Detected (Type 1)	380	441	751	186	543	2301
Original No. of Anomalies Calculated Required for 95% Confidence	191	205	441	125	225	1187

Original No. of Anomalies Intrusively Investigated	89	257	237	128	0	711
No. of Anomalies Could Not be Investigated (as they were underwater)	9	11	14	2	0	36
Other (i.e., Survey Marker, Road, Not Investigated, etc.)	5	29	5	5	0	44
QC Seeds Dug	1	2	1	1	0	5
Original No. of No Contacts	22	28	60	111	0	221
TEMTADS Interrogated (that were not "No Find")	0	0	37	0	23	60
Original No. of Anomalies Intrusively or TEMTADS investigated (not including underwater, survey marker, QC seed, or No Contact)	52	187	194	9	23	465
Total No. of New Anomalies (Types 1 ^A , 3 ^B , 6 ^C and 12 ^D)	238	133	210	14	91	686
Previous No. of Good Anomalies Dug (no longer in data set)	52	187	194	9	23	465
Total No. of New Anomalies that are New QC Seeds	3	2	1	2	0	8
Total No. of New Anomalies that are Old QC Seeds	0	0	0	0	3	3
Total No. of Real Anomalies within each Area	287	318	403	21	111	1140
Total No. of Real Anomalies Calculated Required for 95% Confidence	147	174	197	20	86	624
Additional Randomly Selected Anomalies Requiring Intrusive Investigation	95	0	3	11	63	172
QC Seeds	3	2	1	2	3	11

Notes:

^A point source anomaly^B suspected culture (requested to be investigated by USACE)^C anomaly selected below established threshold (appears to be metallic item)^D selected based on both 2013 and 2014 data (i.e., present in both data sets even though below threshold in one)

Conclusion

CH2M HILL resurveyed all of the transects on which data were collected with the EM61-MK2 towed array because the original data set was shown to be affected by some intrinsic noise in the towed array system. Because a subset of the originally selected anomalies in these areas had already been subjected to either intrusive investigation or advanced electromagnetic induction (EMI) system (TEMTADS 2x2) cued interrogation, a combined analysis was performed on the data sets to determine the quantity and locations of anomalies still needing to be intrusively investigated to achieve the 95% confidence in the makeup of the population of anomalies along the surveyed transects in each of the areas. A total of 183 anomalies (comprising 172 newly selected anomalies and 11 QC seed locations) have been identified for intrusive investigation.

Appendix H

Human Health Risk Assessment Methodology

APPENDIX H

Areas 6, 6A, 6B, and DSA 1 Human Health Risk Assessment Former Raritan Arsenal, Edison, New Jersey

Prepared for

U.S. Army Engineering and Support Center,
Huntsville

**US Army Corps
of Engineers®**

FUDS Project Number: C02NJ008403

U.S. Army Corps of Engineers, New York District

Contract: W912DY-09-D-0060

Task Order: 003

March 2019

Contents

Section	Page
Acronyms and Abbreviations.....	H-v
1 Introduction	H-1-1
1.1 Overview	H-1-1
1.2 Organization of the Risk Assessment.....	H-1-1
2 Data Evaluation and Identification of Chemicals of Potential Concern	H-2-1
2.1 Data Used in the Risk Assessment	H-2-1
2.2 Selection of Chemicals of Potential Concern.....	H-2-1
3 Exposure Assessment.....	H-3-1
3.1 Characterization of Exposure Setting	H-3-1
3.2 Identification of Potential Exposure Pathways.....	H-3-1
3.3 Quantification of Exposure	H-3-2
3.3.1 Calculation of Exposure Point Concentrations	H-3-2
3.3.2 Estimation of Chemical Intake	H-3-2
4 Toxicity Assessment.....	H-4-1
4.1 Noncarcinogenic Toxicity Values	H-4-1
4.2 Carcinogenic Toxicity Values.....	H-4-1
4.3 Derivation of Dermal Toxicity Values.....	H-4-1
4.4 Toxicity Values for Mutagenic Chemicals	H-4-2
5 Risk Characterization	H-5-1
5.1 Approach for Potential Noncarcinogenic Effects.....	H-5-1
5.2 Approach for Potential Carcinogenic Effects	H-5-2
5.3 Approach for Potential Mutagenic Effects	H-5-2
6 Uncertainty Analysis	H-6-1
6.1 Data Evaluation and Identification of Chemicals of Potential Concern.....	H-6-1
6.2 Exposure Assessment	H-6-1
6.3 Toxicity Assessment.....	H-6-2
6.4 Risk Characterization	H-6-2
7 References.....	H-7-1
Attachments	
H-1	RAGS Part D Tables
H-2	Samples Used in the HHRA
H-3	ProUCL Output
H-4	Background Evaluation
H-5	Non-Detect Screening
H-6	Screening Using New Jersey Soil Remediation Standards
H-7	Weighted UCL Calculations

CONTENTS

Section	Page
Table	
H-1 Relative Potency Factors and Toxic Equivalence Factors	

Acronyms and Abbreviations

$\mu\text{g}/\text{m}^3$	microgram per cubic meter
ADAF	age-dependent adjustment factor
ATSDR	Agency for Toxic Substances and Disease Registry
BEQ	benzo(a)pyrene equivalent
bgs	below ground surface
BTV	background threshold value
COPC	constituent of potential concern
cPAH	carcinogenic polycyclic aromatic hydrocarbon
CSF	cancer slope factor
CTE	central tendency exposure
DSA	dredge spoil area
EC	exposure concentration
ELCR	excess lifetime cancer risk
EPA	U.S. Environmental Protection Agency
EPC	exposure point concentration
HHEM	Human Health Evaluation Manual
HHRA	human health risk assessment
HI	hazard index
HQ	hazard quotient
IEUBK	Integrated Exposure Uptake Biokinetic
IRIS	Integrated Risk Information System
IUR	inhalation unit risk
mg/kg	milligram per kilogram
$\text{mg}/\text{kg}\cdot\text{day}$	milligram per kilogram per day
mg/m^3	milligram per cubic meter
MMOA	mutagenic mode of action
N.J.A.C.	New Jersey Administrative Code
NJDEP	New Jersey Department of Environmental Protection
PCB	polychlorinated biphenyl
PEF	particulate emission factor
PPRTV	Provisional Peer-Reviewed Toxicity Value
RAGS	Risk Assessment Guidance for Superfund
RfC	reference concentration

ACRONYMS AND ABBREVIATIONS

RfD	reference dose
RME	reasonable maximum exposure
RPF	relative potency factor
RSL	regional screening level
SL	screening level
SRS	soil remediation standard
SVOC	semivolatile organic compound
TEF	toxic equivalency factor
USACE	U.S. Army Corps of Engineers
UCL	upper confidence limit
UTL	upper tolerance limit

SECTION 1

Introduction

1.1 Overview

This appendix presents the methodology used to assess the potential human health risks associated with exposure to site media at Areas 6, 6A, 6B and Dredge Spoil Area (DSA) 1 at the former Raritan Arsenal in Middlesex County, New Jersey. This human health risk assessment (HHRA) incorporates the general methodology and procedures for performing HHRAs, consistent with guidance documents from the U.S. Environmental Protection Agency (EPA), New Jersey Department of Environmental Protection (NJDEP), and U.S. Army Corps of Engineers (USACE). The following guidance documents were primarily used in the HHRA:

- *Risk Assessment Guidance for Superfund (RAGS), Volume 1: Human Health Evaluation Manual (HHEM), Parts A, D, E, and F* (EPA, 1989, 2001, 2004, 2009)
- *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (EPA, 2002a)
- *Exposure Factors Handbook: 2011 Edition* (EPA, 2011)
- *HHEM, Supplemental Guidance: Update of Standard Default Exposure Factors* (EPA, 2014)
- *Risk Assessment Handbook, Volume I: Human Health Evaluation* (USACE, 1999)
- NJDEP Soil Remediation Standards (SRSs) from Title 7 of the New Jersey Administrative Code (N.J.A.C. 7:26D)

The HHRA, along with the ecological risk assessment, will serve as the basis for the risk management decisions at Area 6, 6A, 6B and DSA 1 (USACE, 1999).

1.2 Organization of the Risk Assessment

The HHRA followed a four-step evaluation process (EPA, 1989) and included the following components:

- **Data Evaluation and Identification of Constituents of Potential Concern (COPCs)**—Reviewed and evaluated available site data and identified the COPCs present at the site that are the focus of the HHRA.
- **Exposure Assessment**—Identified potential current and future human exposure to site media; evaluated potential exposure pathways to site media; and estimated the magnitude, frequency, and duration of exposures.
- **Toxicity Assessment**—Identified the toxicity factors used to characterize potential adverse health effects associated with exposure to COPCs.
- **Risk Characterization**—Incorporated the results of the exposure assessment and toxicity assessment to estimate the potential carcinogenic and noncarcinogenic risks to various receptors under current and future land use scenarios.

These components are described in the following sections. The supporting tables for the HHRA are provided in Attachments H-1 through H-7 of this appendix.

SECTION 2

Data Evaluation and Identification of Chemicals of Potential Concern

The identification of COPCs includes data evaluation and screening steps. The data evaluation step involves gathering and reviewing available site data and identifying a dataset of acceptable quality for the risk assessment. The analytical data for Areas 6, 6A, 6B and DSA 1 were divided into surface soil, subsurface soil, surface water, and sediment data groups. The data were then screened against risk-based criteria that are protective of human health to reduce the dataset to those constituents and media of potential concern.

2.1 Data Used in the Risk Assessment

Samples collected from Area 6, 6A, 6B and DSA 1 were analyzed for various analytical groups, including volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides/polychlorinated biphenyls (PCBs), inorganic chemicals, dioxins/furans, and explosives. Soil, surface water, and sediment samples were included in the HHRA for Area 6, 6A, 6B and DSA 1 and are discussed in Section 6.1 of the RI Report. A list of samples used in the HHRA is provided in Attachment H-2, and the analytical data associated with these samples are provided in Appendix B.

The analytical data used in the HHRA were validated and the following rules were used to identify data to be included in the HHRA:

- Data qualified with J (estimated result), D (detection associated with sample dilution), N (presumptive evidence of the presence of the material), V (detected result), or B (chemical also detected in blank) were treated as detected concentrations and used in the HHRA.
- Data qualified with U or UJ were treated as non-detected concentrations.
- Data qualified with R (rejected) were excluded from the HHRA.

For samples with field duplicate analyses, the higher of the two concentrations was used in the HHRA when both values were detects or when both values were non-detects. In cases where one result was a detected value and the other was a non-detected value, the detected value was used in the HHRA.

The assessment for chlorinated dioxin and furans was performed using the toxic equivalency factor (TEF) methodology (EPA, 2010a). The total concentration of the dioxin and furan congeners is expressed as a toxic equivalent (TEQ) of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). Similarly, potentially carcinogenic polycyclic aromatic hydrocarbon (cPAHs), including benzo[a]pyrene, benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, and indeno[1,2,3-cd]pyrene) were converted to benzo(a)pyrene equivalent (BEQ) concentrations. Relative potency factors (RPFs) were applied to the concentrations of the component cPAHs and the concentrations were summed to derive the BEQ concentration (EPA, 1993). The TEFs applied to dioxin/furan congeners to calculate 2,3,7,8-TCDD TEQ and the RPFs applied to the cPAHs to calculate BEQ are presented in Table H-1.

2.2 Selection of Chemicals of Potential Concern

The maximum detected concentration of each constituent in surface soil (0 to 2 feet below ground surface [bgs]), subsurface soil (2 to 7.7 feet bgs), surface water, and sediment was compared to its respective health-protective screening level (SL). Additionally, detected inorganic chemicals in site soil were also compared to background threshold values (BTVs). The BTVs are the 95 percent upper

SECTION 2 – DATA EVALUATION AND IDENTIFICATION OF CHEMICALS OF POTENTIAL CONCERN

tolerance limit of the 95th percentile (95/95 UTL) for the background soil samples collected from DSAs 1, 2, 3, and 5. The background sampling approach and derivation of the BTVs for the DSAs is provided in Appendix A. The USACE risk assessment guidance (USACE, 2011) recommends eliminating inorganic chemicals as site-related COPCs if they are detected within background levels. However, EPA risk assessment guidance recommends carrying forward all inorganic chemicals above risk-based threshold levels as COPCs, regardless of their occurrence in background soils (EPA, 2002b). Therefore, chemicals were selected as COPCs in the HHRA if the maximum detected concentration exceeded the SL. Chemicals that were carried forward in the risk assessment but detected at concentrations within background levels are discussed in Section 6.5 of the RI Report.

Chemicals that were not detected in any of the samples within an environmental medium were not included in the COPC selection process. Additionally, commonly occurring essential nutrients, including calcium, magnesium, potassium, and sodium were not selected as COPCs (EPA, 1989). A separate comparison to SLs was included in the HHRA for the non-detected chemicals and the results of this screening are discussed in Section 6.5 of the RI Report.

The SLs used in the HHRA are the EPA *Regional Screening Levels for Chemical Contaminants at Superfund Sites* (EPA, 2018). The RSLs based on noncarcinogenic health endpoints are based on a hazard quotient [HQ] equal to [=] 0.1) to account for potential cumulative effects from multiple chemicals affecting the same target organ, with the exception of lead. EPA considers lead to be a special case because toxicity from lead is not based on the “threshold” approach needed to develop a reference dose (RfD). The residential RSL for lead is based on the Integrated Exposure Uptake Biokinetic (IEUBK) Model (EPA, 2010b). RSLs based on carcinogenic health endpoints are based on a target excess lifetime cancer risk [ELCR] of 1×10^{-6} . The RSLs for residential soil were used to screen surface soil, subsurface soil, and sediment concentrations, and the RSLs for tap water were used to screen surface water concentrations. The COPCs identified for Areas 6, 6A, 6B and DSA 1 are discussed in Section 6.1 of the RI Report and the COPC screening is provided in RAGS Part D Tables 2.1 through 2.4 of Attachment H-1.

SECTION 3

Exposure Assessment

The exposure assessment identifies pathways and routes by which an individual may be exposed to the COPCs, and estimates the magnitude, frequency, and duration of potential exposure. Constituent intakes and associated health risks are only quantified for complete exposure pathways. An exposure pathway is considered complete when the following components are present at a site:

- A source (such as chemical residues in an environmental medium)
- A mechanism for chemical release and migration (such as surface runoff)
- An environmental transport medium (such as soil)
- A point of potential human contact (exposure point, such as surface soil)
- A route of intake (such as ingestion, dermal contact, or inhalation)

In the absence of any one of these components, an exposure pathway is considered incomplete and therefore, there is no risk or hazard due to an absence of exposure. In some cases, a receptor may contact a source directly, eliminating the release and transport pathways.

The components of exposure assessment consist of the following:

- Characterization of exposure setting
- Identification of potential exposure pathways
- Quantification of exposure

Each of these steps is discussed in the following sections.

3.1 Characterization of Exposure Setting

The first step of the exposure assessment is to evaluate Areas 6, 6A, 6B and DSA 1 with respect to the physical characteristics at the site and the potential receptor populations at the site or within the surrounding areas. The exposure setting for Areas 6, 6A, 6B and DSA 1 is discussed in Section 6.2 of the RI Report and the potential receptors at the site are listed in Table 1 of Attachment H-1.

3.2 Identification of Potential Exposure Pathways

Area 6, 6A, 6B and DSA 1 are currently under industrial land use and are likely to remain industrial in the future. The potentially complete exposure pathways identified for Areas 6, 6A, 6B and DSA 1, under current and foreseeable future conditions, are discussed in Section 6.2 of the RI Report. Potential exposures to surface soil, total soil, sediment, and surface water were quantitatively evaluated in the HHRA. Groundwater at the former Arsenal currently is not used as a source of drinking water or for industrial purposes, and there are no plans to do so in the future. Potential exposures to groundwater were not evaluated in the HHRA because groundwater at the former Arsenal is being evaluated as a separate operable unit and is being addressed under a separate USACE task order contract. Receptors could potentially be exposed to volatile contaminants in soil and groundwater that migrate to indoor air through vapor intrusion; however, the vapor intrusion pathway is also being evaluated separately and under a separate USACE task order contract, and was therefore not quantitatively evaluated in the HHRA for Areas 6, 6A, 6B and DSA 1. A summary of the previous investigations conducted at the former Arsenal is presented in Section 3 of the RI Report.

3.3 Quantification of Exposure

Exposures were quantified in the HHRA by estimating the exposure point concentrations (EPCs) and chemical intakes for COPCs identified at Areas 6, 6A, 6B and DSA 1. Although USACE guidance recommends conducting risk assessments using two exposure scenarios, only a reasonable maximum exposure (RME)-based evaluation was conducted in the HHRA in the interest of reducing the number of tables presented in the report while providing the necessary information for site management decisions. Therefore, a central tendency exposure (CTE)-based evaluation was not included in the HHRA.

3.3.1 Calculation of Exposure Point Concentrations

EPCs were determined based on measured COPC concentrations in surface soil, total soil, surface water, and sediment. EPCs were estimated for ambient air, assuming soil COPCs could be emitted to air through the dust and volatilization pathways.

The upper confidence limit (UCL) of the mean was calculated for each COPC where at least eight samples were available and at least four detected concentrations were observed. UCLs were estimated using the most recent version of the UCL calculation tool from EPA, ProUCL Version 5.1.002 (EPA, 2016). If more than one UCL was recommended for a COPC by ProUCL, the maximum UCL was selected as the EPC. The maximum detected concentration was used as the EPC if a UCL could not be calculated or if the calculated UCL was greater than the maximum detected value. Steady-state conditions were assumed for COPC concentrations (i.e., EPCs for current conditions were assumed to be representative of concentrations in the future). The EPCs for Areas 6, 6A, 6B and DSA 1 are provided in RAGS Part D Tables 3.1 through 3.4 of Attachment H-1 and the ProUCL output is provided in Attachment H-3.

3.3.2 Estimation of Chemical Intake

The primary references for exposure factors are the standard default exposure factors presented in EPA guidance (EPA, 1989, 2002a, 2004, 2014). In accordance with EPA guidance, COPCs with a mutagenic mode of action (MMOA) require separate exposure evaluations for age ranges 0 to <2, 2 to <16, and 16 and older (EPA, 2005a, 2005b) due to toxicity adjustments required for these age ranges. The exposure factors and equations used to estimate chemical intakes for Area 6, 6A, 6B and DSA 1 are provided in RAGS Part D Tables 4.1 through 4.8 of Attachment H-1.

A site-specific particulate emission factor (PEF) was calculated for maintenance workers, industrial/commercial workers, recreational users/trespassers, and hypothetical future residents. The PEF was calculated using Equation 4-5 and Exhibit D-2 from the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (EPA, 2002a). Another site-specific PEF was calculated for construction/utility workers. The PEF was calculated using Equations 5-5 and 5-6 of the EPA document (EPA, 2002a). It was assumed that daily unpaved road traffic consists of three vehicles (i.e., one 2-ton car and two 20-ton trucks) generating particulates in the vicinity of a hypothetical construction worker.

In accordance with the methodology used to establish the RSLs for soil (EPA, 2018), the dermal exposure route for soil was only quantified for constituents with dermal absorption fraction from soil values, as presented in Exhibit 3-4 of EPA's *Risk Assessment Guidance for Superfund Volume I: HHEM (Part E, Supplemental Guidance for Dermal Risk Assessment)* (EPA, 2004).

SECTION 4

Toxicity Assessment

The oral toxicity values (cancer slope factors [CSFs] and RfDs) and inhalation toxicity values (inhalation unit risks [IURs] and reference concentrations [RfCs]) used in the HHRA were obtained from the EPA recommended hierarchy of sources (EPA, 2003), as follows:

- Tier 1: EPA's Integrated Risk Information System (IRIS) database (EPA, 2019)
- Tier 2: Provisional Peer Reviewed Toxicity Value (PPRTV) database maintained by the EPA's National Center for Environmental Assessment and the Superfund Health Risk Technical Support Center
- Tier 3: Other EPA and non-EPA sources including the Agency for Toxic Substances and Disease Registry (ATSDR) Minimal Risk Levels (ATSDR, 2017), Health Effects Summary Tables (EPA, 1997), and California Environmental Protection Agency Toxicity Criteria Database (2019).

The noncarcinogenic toxicity values are provided in RAGS Part D Tables 5.1 and 5.2 of Attachment H-1, and the carcinogenic toxicity values are provided in RAGS Part D Tables 6.1 and 6.2 of Attachment H-1.

4.1 Non-carcinogenic Toxicity Values

Non-carcinogenic health effects were quantified by comparing intakes or exposures to either RfDs or RfCs. In general, the RfD and RfC are estimates (with uncertainty spanning perhaps an order of magnitude) of daily exposures to the human population (including sensitive subgroups) that are likely to be without an appreciable risk of deleterious effects during a lifetime of exposure (EPA, 1989). The oral RfD is used to estimate adverse effects from the oral route of exposure. The RfC is used to estimate adverse effects from inhalation exposure.

Chronic and subchronic RfDs and RfCs were used in the HHRA. EPA considers exposure durations between 2 weeks and 7 years to be subchronic exposures, in comparison to chronic exposures of more than 7 years. Therefore, subchronic toxicity values were used for a construction/utility worker scenario; however, if subchronic toxicity values were not available, chronic toxicity values were used as a conservative approach.

4.2 Carcinogenic Toxicity Values

Carcinogenic toxicity values (CSFs and IURs) were used in evaluating potential carcinogenic effects associated with exposure to known, probable, or possible carcinogens having a EPA weight-of-evidence classification of A, B, or C, respectively. In accordance with risk assessment guidance (EPA, 1989), CSFs and IURs were used to estimate upper-bound lifetime statistical probabilities of a hypothetical individual developing cancer as a result of exposure to a potential carcinogen.

4.3 Derivation of Dermal Toxicity Values

Oral RfDs and CSFs were converted to dermal RfDs and CSFs using gastrointestinal absorption factors. The values used for this conversion were obtained from RAGS, Part E, Section 4.2 and Exhibit 4-1 (EPA, 2004). Following EPA's recommendation, such a conversion is needed only when a chemical has a gastrointestinal absorption factor of less than 50 percent. If a chemical-specific gastrointestinal absorption factor was not available, gastrointestinal absorption of the chemical was assumed to be 100 percent, and the oral RfD (or oral CSF) was used as the dermal RfD (or dermal CSF) without adjustment.

SECTION 4 – TOXICITY ASSESSMENT

If the gastrointestinal absorption factor was less than 50 percent, the dermal RfD was derived by multiplying the oral RfD by the gastrointestinal absorption factor:

$$RfD_d = RfD_o \times ABS_{GI}$$

Where:

- RfD_d = Dermal reference dose (milligram per kilogram per day [mg/kg-day])
- RfD_o = Oral reference dose (mg/kg-day)
- ABS_{GI} = Fraction of constituent absorbed in the gastrointestinal tract (unitless)

The dermal CSF was derived by dividing the oral CSF by the gastrointestinal absorption factor:

$$CSF_d = \frac{CSF_o}{ABS_{GI}}$$

Where:

- CSF_d = Dermal cancer slope factor (mg/kg-day)⁻¹
- CSF_o = Oral cancer slope factor (mg/kg-day)⁻¹
- ABS_{GI} = Fraction of constituent absorbed in the gastrointestinal tract (unitless)

The dermal RfDs and CSFs are provided in RAGS Part D Tables 5.1 and 6.1 of Attachment H-1, respectively.

4.4 Toxicity Values for Mutagenic Chemicals

Consistent with the EPA cancer guidelines and supplemental guidance (EPA, 2005a and 2005b, respectively), COPCs that act through a MMOA for carcinogenicity were evaluated using age-dependent adjustment factors (ADAFs) for receptor groups that include children ages 16 and under (i.e., adolescent and child recreational users/trespassers and child residents). An ADAF of 10 was applied to the CSF and IUR for receptors from 0 to 2 years of age, and an ADAF of 3 was applied to the CSF and IUR for receptors from 2 to 6 years of age and 6 to 16 years of age. The equations used to quantify potential risks for mutagenic chemicals are provided in Section 5.3.

SECTION 5

Risk Characterization

Potential human health risks are discussed separately for carcinogenic and noncarcinogenic COPCs because of the different toxicological endpoints, relevant exposure durations, and methods used to estimate risk. EPA Superfund guidance generally considers an acceptable site ELCR range to be within 1 to 100 in a million (1×10^{-6} to 1×10^{-4}). Generally, remedial actions are not warranted for site media with an ELCR of 1×10^{-4} or below, or a hazard index (HI) of 1 or less. The potential risks for Areas 6, 6A, 6B and DSA 1 are summarized in Section 6.4 of the RI Report.

5.1 Approach for Potential Noncarcinogenic Effects

The HHRA evaluated the potential for noncarcinogenic effects by comparing exposure intakes of each COPC over a specified time period (chronic or subchronic) with RfDs derived for similar exposure periods. For the inhalation exposure route, noncarcinogenic effects were evaluated by comparing the exposure concentration (EC) of each COPC with its RfC. This ratio of exposure to toxicity is referred to as an HQ. The HQ assumes that there is a level of exposure below which it is unlikely for even sensitive populations to experience adverse health effects. If the exposure level exceeds this threshold, there is the potential for noncancer health effects to occur. The HQ is calculated as follows:

$$HQ = \frac{Intake}{RfD} \quad \text{or} \quad HQ = \frac{EC}{RfC}$$

Intake and RfD are expressed in the same units (mg/kg-day) and represent the same exposure period (chronic or subchronic). Similarly, inhalation ECs and RfCs are expressed in the same units (milligram per cubic meter [mg/m³]). An HQ that exceeds 1 (that is, intake exceeds the RfD or EC exceeds the RfC) indicates that there is a potential for adverse health effects associated with exposure to that COPC.

To assess the potential for noncarcinogenic health effects posed by exposure to multiple COPCs and exposure routes, an HI was estimated by summing the individual HQs (EPA, 1989). The HI is a sum of noncarcinogenic hazards associated with exposure to more than one COPC and assumes that the exposure from multiple routes are additive. Synergistic or antagonistic interactions between COPCs are not quantified. The HI is equal to the sum of the HQs and is calculated as follows:

$$HI = \frac{I_1}{RfD_1} + \frac{I_2}{RfD_2} + \dots + \frac{I_i}{RfD_i} + \frac{EC_1}{RfC_1} + \frac{EC_2}{RfC_2} + \dots + \frac{EC_j}{RfC_j}$$

where:

- I = Intake level (mg/kg-day)
- RfD = Reference dose (mg/kg-day)
- I_i = Intake level for the "i"th constituent (mg/kg-day)
- RfD_i = Reference dose for the "i"th constituent (mg/kg-day)
- EC = Exposure concentration (mg/m³)
- RfC = Reference concentration (mg/m³)
- EC_j = Exposure concentration for the "j"th constituent (mg/m³)
- RfC_j = Reference concentration for the "j"th constituent (mg/m³)

HI's were calculated in a phased approach. Screening HI's were calculated by summing all HQs for a receptor, and final HI's were calculated for each potential receptor by target organ (or target effect or target system). If a final HI exceeds 1, there is a potential for a noncarcinogenic effect on that target organ/effect/system.

5.2 Approach for Potential Carcinogenic Effects

The potential for carcinogenic effects was evaluated by estimating the ELCR. The ELCR is the incremental increase in the probability of developing cancer during one's lifetime (as a result of exposure to site media) above the probability of developing cancer from non-site exposures.

Potential ELCRs associated with exposure to individual carcinogens were calculated using CSFs and chemical intakes for oral and dermal contact exposures and IURs and ECs for inhalation exposures. The linear low-dose equation was used to estimate the incremental probability of an individual developing cancer over a lifetime as a result of exposure to potential carcinogens. Estimated ELCRs are calculated by multiplying the intake by the CSF or inhalation EC by the IUR.

$$ELCR = Intake \times CSF \quad \text{or} \quad ELCR = Exposure\ Concentration \times IUR$$

The theoretical probability of developing cancer as a consequence of exposure to two or more COPCs and by two or more exposure pathways was calculated by summing the risk estimates for each COPC in the appropriate scenarios using the following equations:

$$Total\ ELCR = (I_1 \times CSF_1) + (I_2 \times CSF_2) + \dots (I_i \times CSF_i) + \\ (EC_1 \times IUR_1) + (EC_2 \times IUR_2) + \dots (EC_j \times IUR_j)$$

where:

- I = Intake level (mg/kg-day)
- CSF = Cancer slope factor (mg/kg-day)⁻¹
- I_i = Intake level for the 'i'th constituent (mg/kg-day)
- CSF_i = Cancer slope factor for the 'i'th constituent (mg/kg-day)⁻¹
- EC = Exposure concentration [microgram per cubic meter (µg/m³)]
- IUR = Inhalation unit risk (µg/m³)⁻¹
- EC_j = Exposure concentration for the 'j'th constituent (µg/m³)
- IUR_j = Inhalation unit risk for the 'j'th constituent (µg/m³)⁻¹

5.3 Approach for Potential Mutagenic Effects

For COPCs acting with a MMOA, the ELCR was calculated using age-dependent adjustment factors (EPA, 2005a, 2005b), based on the equations provided below:

For oral and dermal exposures:

$$ELCR = (10 \times CDI_{0-2\ yrs} + 3 \times CDI_{2-6\ yrs} + 3 \times CDI_{6-16\ yrs} + CDI_{16-26\ yrs}) \times CSF$$

For inhalation exposures:

$$ELCR = (10 \times EC_{0-2\ yrs} + 3 \times EC_{2-6\ yrs} + 3 \times EC_{6-16\ yrs} + EC_{16-26\ yrs}) \times IUR$$

Where:

- CDI(i-jyrs) = Chronic daily intake (mg/kg-day) from i to j years;
- EC(i-jyrs) = Inhalation exposure concentration (mg/m³) from i to j years;
- CSF = Cancer slope factor (mg/kg-day)⁻¹;
- IUR = Inhalation unit risk (mg/m³)⁻¹.

SECTION 6

Uncertainty Analysis

The assumptions used in the HHRA have inherent uncertainty. While it is theoretically possible that this leads to underestimates of potential risk, the use of upper-bound assumptions most likely results in conservative estimates of potential risks. A receptor group's potential exposure and subsequent potential risk are influenced by the exposure scenario and dose/response and vary on a case-by-case basis. The general uncertainties associated with the HHRA are discussed below. Site-specific uncertainties associated with Areas 6, 6A, 6B and DSA 1 are provided in Section 6.5 of the RI Report.

6.1 Data Evaluation and Identification of Chemicals of Potential Concern

The purpose of COPC selection is to determine which constituents, if any, are present at Area 6, 6A, 6B and DSA 1 at concentrations requiring evaluation in the HHRA. Uncertainty with respect to COPC selection can arise from many sources, such as the age and analytical quality of the data used to characterize each area and the process used to select the data and COPCs in the HHRA.

Chemicals that were not detected in an exposure medium were not included in the COPC screening process. However, a separate screening was included in the HHRA for these chemicals and the maximum non-detected values were compared to the respective EPA RSLs. The results of the comparison are provided in Attachment H-5 and are discussed in Section 6.5 of the RI Report.

COPCs were selected by screening the maximum detected concentrations against the EPA's RSLs. A separate screening evaluation was also included that compared maximum detected concentrations against the NJDEP SRS values (see Attachment H-6). The differences and potential uncertainties associated with using the RSLs over the NJDEP SRS values are discussed in Section 6.5 of the RI Report.

The age of the analytical data contributes some uncertainty to the HHRA. Historical data collected in 1994 and 2005 were used to estimate potential exposures and risks. These data may no longer be representative of site conditions since volatilization, leaching, and degradation most likely has occurred over time. The degree of potential overestimation of site concentrations, and risks, is unknown.

6.2 Exposure Assessment

The most significant source of uncertainty associated with the exposure assessment is the underlying assumption that contact with affected media would occur under current land use conditions, and that the land use and human activity patterns assumed for the hypothetical future scenarios would occur.

Most of the exposure pathways analyzed are assumed, and exposure factors used for quantitation of exposure are conservative and reflect worst-case or upper-bound assumptions. For example, the site is not expected to be used for residential use, so the inclusion of this receptor in the assessment is conservative, but is necessary to evaluate unrestricted use. In general, exposures are assumed to occur under conservative and protective assumptions; therefore, estimated risks tend to be biased high for the various receptors.

The future exposure scenarios for a hypothetical resident and construction/utility worker add additional conservatism by assuming that the subsurface soil will be mixed with surface soil during any future construction activities.

EPCs were based on UCLs or maximum detected concentrations which could lead to an overestimation of average exposure because receptors are assumed to be exposed to the UCL or maximum detected

SECTION 6 – UNCERTAINTY ANALYSIS

concentration for the entire exposure duration. It is also noted that using the sample maximum is not necessarily a conservative estimate of the EPC because concentrations in the environmental medium could be greater than the maximum concentration from the sample population.

6.3 Toxicity Assessment

Carcinogenic slope factors developed by the EPA represent upper bound estimates. Any carcinogenic risks generated by this assessment should be regarded as an upper bound estimate on the potential carcinogenic risks rather than an accurate representation of carcinogenic risk. The true carcinogenic risk is likely to be less than the predicted value.

6.4 Risk Characterization

The uncertainties identified in each component of the HHRA ultimately contribute to uncertainty in risk characterization. The addition of risks and HIs across pathways and chemicals contributes to uncertainty based on the interaction of chemicals, such as additivity, synergism, potentiation, and susceptibility of exposed receptors. The simple assumption of additivity used for this site may or may not be accurate and may over- or under-estimate risk.

Table

Table H-1. Relative Potency Factors and Toxic Equivalence Factors*Areas 6, 6A, 6B, and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey*

Carcinogenic PAHs^a	RPF
Benzo(a)anthracene	0.1
Benzo(a)pyrene	1
Benzo(b)fluoranthene	0.1
Benzo(k)fluoranthene	0.01
Chrysene	0.001
Dibenz(a,h)anthracene	1
Indeno(1,2,3-c,d)Pyrene	0.1
Dioxins/Furans^b	TEF
2,3,7,8-Tetrachlorodibenzofuran	0.1
2,3,7,8-Tetrachlorodibenzo-p-dioxin	1
Octachlorodibenzofuran	0.0003
Octachlorodibenzo-p-dioxin	0.0003

Notes:

^a Source: U.S. Environmental Protection Agency (EPA). 1993. *Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons*. EPA/600/R-93/089. July.

^b 2,3,7,8-TCDD TEFs were developed by the World Health Organization and published in *The 2005 World Health Organization Reevaluation of Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-Like Compounds* (Van den Berg et al., 2006).

RPF = relative potency factor

BAP = benzo(a)pyrene

PAH = polycyclic aromatic hydrocarbon

TCDD = 2,3,7,8-tetrachlorodibenzo-p-dioxin

TEF = toxic equivalence factor

TEQ = toxic equivalent

APPENDIX H - Human Health Risk Assessment Methodology

TABLE 1
SELECTION OF EXPOSURE PATHWAYS
Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Surface Soil	Surface Soil	Surface Soil (0-2 feet bgs)	Maintenance Worker	Adult	Dermal	On-site	Quant	Maintenance workers may contact surface soil while working at the site.
						Ingestion	On-site	Quant	Maintenance workers could incidentally ingest surface soil while working at the site.
		Ambient Air	Emissions from Surface Soil (0-2 feet bgs)	Maintenance Worker	Adult	Inhalation	On-site	Quant	Maintenance workers could inhale vapors and dust from surface soil while working at the site.
Future	Surface Soil	Surface Soil	Surface Soil (0-2 feet bgs)	Industrial/ Commercial Worker	Adult	Dermal	On-site	Quant	Industrial or commercial workers could contact surface soil while working at the site.
						Ingestion	On-site	Quant	Industrial or commercial workers could incidentally ingest surface soil while working at the site.
				Recreational User/ Trespasser	Adult, Adolescent, Child	Dermal	On-site	Quant	Recreational users or trespassers could contact surface soil while at the site.
						Ingestion	On-site	Quant	Recreational users or trespassers could incidentally ingest surface soil while at the site.
				Resident	Adult, Child	Dermal	On-site	Quant	Hypothetical future residents could contact surface soil if the site is developed for residential use.
						Ingestion	On-site	Quant	Hypothetical future residents could incidentally ingest surface soil if the site is developed for residential use.
		Ambient Air	Emissions from Surface Soil (0-2 feet bgs)	Industrial/ Commercial Worker	Adult	Inhalation	On-site	Quant	Industrial or commercial workers could inhale vapors and dust from surface soil while working at the site.
						Inhalation	On-site	Quant	Recreational users or trespassers could inhale vapors and dust from surface soil.
				Resident	Adult, Child	Inhalation	On-site	Quant	Hypothetical future residents could inhale vapors and dust from surface soil if the site is developed for residential use.
						Inhalation	On-site	Quant	Hypothetical future residents could inhale vapors and dust from surface and subsurface soil (i.e., total soil) if the site is developed for residential use and the soil becomes comingled during construction activities.
		Total Soil	Total Soil (0-7.7 feet bgs)	Resident	Adult, Child	Dermal	On-site	Quant	Hypothetical future residents could contact surface and subsurface soil (i.e., total soil) if the site is developed for residential use and the soil becomes comingled during construction activities.
						Ingestion	On-site	Quant	Hypothetical future residents could incidentally ingest surface and subsurface soil (i.e., total soil) if the site is developed for residential use and the soil becomes comingled during construction activities.
				Construction/ Utility Worker	Adult	Dermal	On-site	Quant	Construction or utility workers may contact surface and subsurface soil (i.e., total soil) while working at the site.
						Ingestion	On-site	Quant	Construction or utility workers could incidentally ingest surface and subsurface soil (i.e., total soil) while working at the site.
		Ambient Air	Emissions from Total Soil (0-7.7 feet bgs)	Resident	Adult, Child	Inhalation	On-site	Quant	Hypothetical future residents could inhale vapors and dust from surface and subsurface soil (i.e., total soil) if the site is developed for residential use and the soil becomes comingled during construction activities.
						Inhalation	On-site	Quant	Construction or utility workers could inhale vapors and dust from surface and subsurface soil (i.e., total soil) while working at the site.
	Surface Water	Surface Water	Surface Water	Recreational User/ Trespasser	Adult, Adolescent, Child	Dermal	On-site	Quant	Recreational users or trespassers could contact surface water at the site.
						Ingestion	On-site	Quant	Recreational users or trespassers could incidentally ingest surface water at the site.
	Sediment	Sediment	Sediment	Recreational User/ Trespasser	Adult, Adolescent, Child	Dermal	On-site	Quant	Recreational users or trespassers could contact sediment at the site.
						Ingestion	On-site	Quant	Recreational users or trespassers could incidentally ingest sediment at the site.

Notes:
bgs: below ground surface
Quant: Quantitative

TABLE 2.1
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN

[1] Maximum concentration is used for screening.

[2] Background soil values are the 95% upper tolerance limit with 95% coverage (95/95 UTL) for the dredge spoil areas (DSAs).

[3] Regional Screening Levels for Residential Soil (November 2018). Concentrations for non-carcinogenic health effects are based on a HQ=0.1.
RSL value for pyrene used for benzo(g,h,i)perylene.
RSL value for anthracene used for phenanthrene.
RSL value for trivalent chromium used for total chromium.
RSL value for mercuric chloride (and other mercury salts) used for mercury.
RSL value for thallium soluble salts used for thallium.

[4] Rationale Codes

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/
To Be Considered

BEQ = Benzo(a)pyrene equivalent

c = Carcinogenic

HQ = Hazard quotient

HHRA = Human Health Risk Assessment

J = result is estimated

J - = result is estimated, biased low

mg/kg = milligram per kilogram

NA = Not available

n = Noncarcinogenic

PAH = Polycyclic aromatic hydrocarbon

TABLE 2.1
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN
Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

Scenario Timeframe: Current/Future, Future
Medium: Surface Soil
Exposure Medium: Surface Soil and Ambient Air

Exposure Point	CAS Number	Chemical	Minimum Concentration Qualifier	Maximum Concentration Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3)	Potential ARAR/TBC Value (6)	Potential ARAR/TBC Source (6)	COPC Flag	Rationale for Selection or Deletion (4)
----------------	------------	----------	---------------------------------	---------------------------------	-------	-----------------------------------	---------------------	---------------------------	--------------------------------------	----------------------	------------------------------	------------------------------	-------------------------------	-----------	---

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: No Toxicity Information (NTX)
Essential Nutrient (NUT)
Below Screening Level (BSL)

RSL = Regional Screening Level
V = Detected Value
2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

- [5]

Carcinogenic PAHs [benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene] will be addressed in the HHRA as 'BEQ'.
- [6]

No ARAR/TBC values are needed for Areas 6, 6A, and 6B.

[1]

Maximum concentration is used for screening.

[2]

Regional Screening Levels for Tapwater (November 2018). Concentrations for non-carcinogenic health effects are based on an HQ=0.1.
RSL value for 2-Amino-4,6-Dinitrotoluene and 4-Amino-2,6-Dinitrotoluene used for Amino-DNTs
RSL value for trivalent chromium used for total chromium.
RSL value for mercuric chloride (and other mercury salts) used for mercury.

[3]

Rationale Codes

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Essential Nutrient (NUT)
Below Screening Level (BSL)

[4]

No ARAR/TBC values are needed for Areas 6, 6A, and 6B.

COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/
To Be Considered
B = Analyte also detected in associated blank
c = Carcinogenic
E = result is estimated
N = Presumptive evidence of the presence of the material
HQ = Hazard quotient
J = result is estimated
J - = result is estimated, biased low
L = Maximum Contaminant Level is used for Lead
NA = Not available
n = Noncarcinogenic
RSL = Regional Screening Level
V = Detected Value
µg/L = microgram per liter

- [1]

Maximum concentration is used for screening.
- [2]

Regional Screening Levels for Residential Soil (November 2018). Concentrations for non-carcinogenic health effects are based on a HQ=0.1.
RSL value for acenaphthene used for acenaphthylene.
RSL value for pyrene used for benzo(g,h,i)perylene.
RSL value for anthracene used for phenanthrene.
RSL value for trivalent chromium used for total chromium.
RSL value for mercuric chloride (and other mercury salts) used for mercury.
RSL value for chlordane used for alpha-chlordane.
RSL value for chlordane used for gamma-chlordane.
- [3]

Rationale Codes

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: No Toxicity Information (NTX)
Essential Nutrient (NUT)
Below Screening Level (BSL)
- [4]

Carcinogenic PAHs [benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene] will be addressed in the HHRA as 'BEQ'.
- [5]

No ARAR/TBC values are needed for Areas 6, 6A, and 6B.
- COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/
To Be Considered
B = Analyte also detected in associated blank
BEQ = Benzo(a)pyrene equivalent
c = Carcinogenic
D = dilutions required to perform the analysis
HQ = Hazard quotient
HHRA = Human Health Risk Assessment
J = result is estimated
J - = result is estimated, biased low
mg/kg = milligram per kilogram
NA = Not available
N = Presumptive evidence of the presence of the material
n = Noncarcinogenic
PAH = Polycyclic aromatic hydrocarbon
RSL = Regional Screening Level
V = Detected Value
2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

TABLE 3.1.RME

Notes:

ProUCL, Version 5.1.002 used to determine distribution of data using the Shapiro-Wilk W Test. ProUCL used to calculate RME EPC, following recommendations based on distribution and standard deviation in users guide (EPA. June 2016. ProUCL, Version 5.1.002 Prepared by Lockheed Martin Environmental Services).

Statistics Definitions: KM - Kaplan-Meier; Max - Maximum Detected Value; BCA - Bias Corrected Accelerated

- (1) Shapiro-Wilk W/Lilliefors Test indicates data are log-normally distributed.
- (2) Shapiro-Wilk W/Lilliefors Test indicates data are normally distributed.
- (3) Anderson-Darling and/or Kolmogorov-Smirnov Tests indicate data are gamma distributed.
- (4) Distribution tests are inconclusive; therefore, the nonparametric UCL was used as the EPC.
- (5) The maximum detected concentration was used as the EPC because there were less than 8 samples or too few detected concentrations.

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

BEQ = Benzo(a)pyrene equivalent

G = Gamma distribution

J = result is estimated

mg/kg = Milligram per kilogram

N = Normal distribution

NA = Not available

V = Detected Value

APPENDIX H - Human Health Risk Assessment Methodology

Notes:

- (1) Chemicals with a Henry's Law Constant value greater than 1×10^{-5} atm-m³/mole or a vapor pressure greater than or equal to 1 mm Hg were identified as sufficiently volatile.
- (2) Selection of exposure point concentrations presented on Table 3.1.RME.
- (3) Ambient air exposure point concentration for residents, recreational users/trespassers, maintenance workers, and industrial/commercial workers, calculated using the chemical-specific Volatilization Factor (VF) and Particulate Emission Factor (PEF) of 7.50×10^8 m³/kg as shown below. Derivation of PEF is presented on Table 4.2.RME Supplement.

$$\text{Concentration in ambient air (mg/m}^3\text{)} = \text{Concentration in soil (mg/kg)} * (1/\text{PEF} + 1/\text{VF}) (\text{m}^3/\text{kg})$$

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

BEQ = Benzo(a)pyrene equivalent

mg/kg = Milligram per kilogram

mg/m³ = Milligram per cubic meter

NA = Not available or not applicable

Notes:

- (1) Chemicals with a Henry's Law Constant value greater than 1×10^{-5} atm-m³/mole or a vapor pressure greater than or equal to 1 mm Hg were identified as sufficiently volatile.
- (2) Derivation of Volatilization Factor (VF) is presented on Table 4.2.RME Supplement B.
- (3) Selection of exposure point concentrations presented on Table 3.2.RME.
- (4) Ambient air exposure point concentration for residents, calculated using a Particulate Emission Factor (PEF) of 7.50×10^8 m³/kg as shown below. Derivation of PEF is presented on Table 4.2.RME Supplement.
- (5) Construction worker ambient air exposure point concentration calculated using a PEF of 8.86×10^6 m³/kg as shown below. Derivation of PEF is presented on Table 4.8.RME Supplement B.

$$\text{Concentration in ambient air (mg/m}^3\text{)} = \text{Concentration in soil (mg/kg)} * (1/\text{PEF}+1/\text{VF}) (\text{m}^3/\text{kg})$$

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

BEQ = Benzo(a)pyrene equivalent

mg/kg = Milligram per kilogram

mg/m³ = Milligram per cubic meter

Notes:

ProUCL, Version 5.1.002 used to determine distribution of data using the Shapiro-Wilk W Test. ProUCL used to calculate RME EPC, following recommendations based on distribution and standard deviation in users guide (EPA, June 2016. ProUCL, Version 5.1.002 Prepared by Lockheed Martin Environmental Services).

Statistics Definitions: KM - Kaplan-Meier; Max - Maximum Detected Value; GROS - Gamma Regression on Order Statistics

- (1) Shapiro-Wilk W/Lilliefors Test indicates data are log-normally distributed.
- (2) Shapiro-Wilk W/Lilliefors Test indicates data are normally distributed.
- (3) Anderson-Darling and/or Kolmogorov-Smirnov Tests indicate data are gamma distributed.
- (4) Distribution tests are inconclusive; therefore, the nonparametric UCL was used as the EPC.
- (5) The maximum detected concentration was used as the EPC because there were less than 8 samples or too few detected concentrations.
- (6) The maximum detected concentration was used as the EPC because the UCL was greater than the maximum detected concentration.
- (7) The arithmetic mean was used as the EPC for lead.

G = Gamma distribution

J = result is estimated

J - = result is estimated, biased low

µg/L = microgram per liter

N = Normal distribution

NA = Not available

V = Detected Value

Metals	7440-28-0	Thallium	NA	(1)
Metals	7440-62-2	Vanadium	NA	(1)

Notes:

Dermal Absorption Fractions are obtained from EPA RAGS Part E Exhibit 3-4 (EPA, 2004) and RSL Table (EPA, November 2018).

(1) As listed in the RSL table (EPA, 2018), a dermal absorption fraction is not available for heptachlor epoxide. For inorganics, the speciation of the compound is critical to the dermal absorption and there are too little data to extrapolate a reasonable default value (EPA, 2004). Therefore, consistent with EPA RAGS Part E (EPA, 2004) and the RSL Table (EPA, 2018), dermal exposure is not assessed for these constituents.

TABLE 4.8.RME Supplement B
PARTICULATE EMISSION FACTOR - CONSTRUCTION WORKER
REASONABLE MAXIMUM EXPOSURE
Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

PEF Equations:

$$\frac{Q}{C_{Sr}} = A \times \exp \left[\frac{(\ln A_{site} - B)^2}{C} \right]$$

Equation 5-6 (EPA, 2002)

$$PEF_{SC} = \frac{Q}{C_{Sr}} \times \frac{1}{F_D} \times \frac{T \times A_R}{556 \times \left(\frac{W}{3}\right)^{0.4} \times \left(\frac{365 \text{ d/yr} - p}{365 \text{ d/yr}}\right) \times \sum VKT}$$

Equation 5-5 (EPA, 2002)

$$F_D = 0.1852 + \frac{5.3537}{t_c} + \frac{-9.6318}{t_c^2}$$

Equation E-16 (EPA, 2002)

PEF and Box Model Input Parameters

Parameter	Definition	Value	Units	Source
Q/C_{Sr}	inverse ratio of the geometric mean air concentration to the emission flux at the center of a square source	20.5	m	calculated
A	Constant	12.9351	unitless	default (Eqn. 5-6; EPA, 2002)
B	Constant	5.7383	unitless	default (Eqn. 5-6; EPA, 2002)
C	Constant	71.7711	unitless	default (Eqn. 5-6; EPA, 2002)
A_{site}	Areal extent of site contamination	1	acre	professional judgment ¹
PEF_{SC}	subchronic road particulate emission factor	8.86E+06	m ³ /kg	calculated
F_D	Dispersion correction factor	0.188	unitless	calculated
t_c	duration of construction (250 days for 8 hr/day)	2,000	hr	assumed
T	total time over which construction occurs ($t_c \times 3600$ s/hr)	7,200,000	s	assumed
A_R	surface area of contaminated road segment (square root of site surface contamination configured as a square x default width of road segment of 20 ft)	388	m ²	calculated
W	mean weight of vehicle [(1 car @ 2 tons/car) + (2 trucks @ 20 tons/truck)] / 3 vehicles	14	tons	assumed
p	number of days with at least 0.01 inches of precipitation	110	days/yr	Exhibit 5-2 (EPA, 2002)
VKT	sum of fleet vehicle kilometers traveled during the exposure duration (assumed 3 vehicles x 0.24 km/day x 250 days)	48	km	assumed

Notes:

¹ An exposure area of 1 acre was assumed, based on best professional judgment.

TABLE 5.1
NON-CANCER TOXICITY DATA -- ORAL/DERMAL
Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

Chemical of Potential Concern	Chronic/ Subchronic	Oral RfD		Oral Absorption Efficiency for Dermal	Absorbed RfD for Dermal (2)		Primary Target Organ(s)	Combined Uncertainty/Modifying Factors	RfD: Target Organ(s)	
		Value	Units	(1)	Value	Units			Source(s)	Date(s) (MM/DD/YYYY)

Note:

- (1) Source: Risk Assessment Guidance for Superfund, Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Section 4.2 and Exhibit 4-1. USEPA recommends that the oral RfD should not be adjusted to estimate the absorbed dose for compounds when the absorption efficiency is greater than 50%. Constituents that do not have oral absorption efficiencies reported on this table were assumed to have an oral absorption efficiency greater than 50%.
- (2) Adjusted based on RAGS Part E.
- (3) Toxicity information for Mercuric Chloride (and other Mercury salts) is used for Mercury.
- (4) As cited in Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites (EPA, June 2017).

Notes:

- (1) Source: Risk Assessment Guidance for Superfund. Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Section 4.2 and Exhibit 4-1. EPA recommends that the oral slope factor should not be adjusted to estimate the absorbed dose for compounds when the absorption efficiency is greater than 50%. Constituents that do not have oral absorption efficiencies reported on this table were assumed to have an oral absorption efficiency greater than 50%.

- (3) Oral CSF for Aroclor-1260 is the high risk and persistence, upper-bound slope factor.

- (4) This chemical operates with a mutagenic mode of action (EPA 2005) and would exhibit a greater effect in early-life versus later-life exposure.

Chemical-specific toxicity data are not available for childhood and early-life exposures; thus, EPA (2005) default age-dependant adjustment factors (ADAF) will be applied to the slope factor as follows:

AGE	AGE ADAF
0-<2	10
2-<16	3
16-<30	1

Weight of Evidence definitions:

Group A chemicals (known human carcinogens) are agents for which there is sufficient evidence to support the causal association between exposure to the agents in humans and cancer.

Group B1 chemicals (probable human carcinogens) are agents for which there is limited evidence of possible carcinogenicity in humans.

Group B2 chemicals (probable human carcinogens) are agents for which there is sufficient evidence of carcinogenicity in animals but inadequate or a lack of evidence in humans.

Group C chemicals (possible human carcinogens) are agents for which there is limited evidence of carcinogenicity in animals and inadequate or a lack of human data.

Group D chemicals (not classifiable as to human carcinogenicity) are agents with inadequate human and animal evidence of carcinogenicity or for which no data are available.

Notes:

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

BEQ = Benzo(a)pyrene equivalent

CSF = Cancer slope factor

EPC = Exposure point concentration

NA = Not applicable/Not available

RfD = Reference dose

mg/kg = milligram per kilogram

mg/kg/day = milligram per kilogram per day

Notes:

2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent

BEQ = Benzo(a)pyrene equivalent

CSF = Cancer slope factor

EPC = Exposure point concentration

NA = Not applicable/Not available

RfD = Reference dose

µg/L = microgram per liter

mg/kg = milligram per kilogram

mg/kg/day = milligram per kilogram per day

APPENDIX H - Human Health Risk Assessment Methodology

Inorganics: DAevent (mg/cm²-event) =

$$DA_{event} = Kp \times CW \times t_{event} \times 0.001 \text{ mg/ug} \times 0.001 \text{ l/cm}^3 \quad (\text{Eq 1})$$

Organics: DAevent (mg/cm²-event) =

$$DA_{event} = \begin{matrix} t_{event} \leq t^*: DA_{event} \text{ (mg/cm}^2\text{-event)} = \\ 2 \times FA \times Kp \times Cw \times (\text{sqrt}((6 \times \tau \times t_{event}) / (3.1415))) \times CF1 \times CF2 \end{matrix} \quad (\text{Eq 2})$$

$$\begin{matrix} t_{event} > t^*: DA_{event} \text{ (mg/cm}^2\text{-event)} = \\ FA \times Kp \times CW \times (t_{event}/(1+B) + 2 \times \tau \times ((1 + 3B + 3B^2)/(1+B)^2)) \times CF1 \times CF2 \end{matrix} \quad (\text{Eq 3})$$

Notes:

Values for permeability constants, B, tau, t^* , and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final)*. EPA/540/R/99/005.

B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).

cm/hr - centimeter per hour

hr - hour

mg/cm²-event - milligram per square centimeter event

NA - Not applicable

ug/L - microgram per liter

Notes:
2,3,7,8-TCDD TEQ = 2,3,7,8-tetrachlorodibenzo-p-dioxin toxic equivalent
BEQ = Benzo(a)pyrene equivalent
CSF = Cancer slope factor
EPC = Exposure point concentration
NA = Not applicable/Not available
RfD = Reference dose
µg/L = microgram per liter
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.829

UCL Statistics for Data Sets with Non-Detects**Suggested UCL to Use**

95% Student's-t UCL 181.5

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002) and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.

For additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	1.433	Mean	6.061

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Maximum Detect	83.2	Maximum Non-Detect	0.5
Variance Detects	1126	Percent Non-Detects	12.5%
Mean Detects	24.85	SD Detects	33.55
Median Detects	10.8	CV Detects	1.35
Skewness Detects	1.296	Kurtosis Detects	-0.0709
Mean of Logged Detects	2.085	SD of Logged Detects	1.828

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.**For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).****Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.0**

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Notes:

EPA's Regional Screening Levels for Chemical Contaminants at Superfund Sites (November, 2018) for residential soil were used in the comparison.

RSL based on noncarcinogenic endpoints based on hazard quotient of 0.1. RSL based on carcinogenic endpoints based on cancer risk of 10⁻⁶.

RSL value for 1,4-dichlorobenzene used as a surrogate for 1,3-dichlorobenzene.

RSL value for Nitrobenzene used for 2-Nitrophenol.

RSL value for 2-nitroaniline used for 3-nitroaniline.

RSL value for Nitrobenzene used for 4-Nitrophenol.

RSL value for acenaphthene used for acenaphthylene.

RSL value for diethyl phthalate used for dimethyl phthalate.

RSL value for chlordane used for alpha-chlordane.

RSL value for technical-HCH used for delta-BHC.

RSL value for endosulfan used for endosulfan I.

RSL value for endosulfan used for endosulfan II.

RSL value for endosulfan used for endosulfan sulfate.

RSL value for endrin used for endrin aldehyde.

RSL value for chlordane used for gamma-chlordane.

RSL value for 1,3-dichloropropene used as a surrogate for cis-1,3-dichloropropene.

RSL value for cis-1,2-dichloroethene used for total-1,2-dichloroethene.

RSL value for 1,3-dichloropropene used as a surrogate for trans-1,3-dichloropropene.

mg/kg = milligram per kilogram

NA = not available

ND = Non-detect

RSL = Regional Screening Level

VINYL CHLORIDE	75-01-4	0 / 11	mg/kg	1.10E-02	1.60E-02	5.90E-02	No
XYLENES (TOTAL)	1330-20-7	0 / 11	mg/kg	6.00E-03	8.00E-03	5.80E+01	No

Notes:

EPA's Regional Screening Levels for Chemical Contaminants at Superfund Sites (November, 2018) for residential soil were used in the comparison.

RSL based on noncarcinogenic endpoints based on hazard quotient of 0.1. RSL based on carcinogenic endpoints based on cancer risk of 10⁻⁶.

RSL value for 1,4-dichlorobenzene used as a surrogate for 1,3-dichlorobenzene.

RSL value for Nitrobenzene used for 2-Nitrophenol.

RSL value for 2-nitroaniline used for 3-nitroaniline.

RSL value for Nitrobenzene used for 4-Nitrophenol.

RSL value for acenaphthene used for acenaphthylene.

RSL value for diethyl phthalate used for dimethyl phthalate.

RSL value for chlordanes used for alpha-chlordane.

RSL value for technical-HCH used for delta-BHC.

RSL value for endosulfan used for endosulfan I.

RSL value for endosulfan used for endosulfan II.

RSL value for endosulfan used for endosulfan sulfate.

RSL value for endrin used for endrin aldehyde.

RSL value for chlordanes used for gamma-chlordane.

RSL value for 1,3-dichloropropene used as a surrogate for cis-1,3-dichloropropene.

RSL value for cis-1,2-dichloroethene used for total-1,2-dichloroethene.

RSL value for 1,3-dichloropropene used as a surrogate for trans-1,3-dichloropropene.

mg/kg = milligram per kilogram

XYLENES (TOTAL)	1330-20-7	0 / 25	ug/L	1.00E+00	1.00E+00	1.90E+01	No

Notes:

EPA's Regional Screening Levels for Chemical Contaminants at Superfund Sites (November, 2018) for tapwater were used in the comparison.

RSL based on noncarcinogenic endpoints based on hazard quotient of 0.1. RSL based on carcinogenic endpoints based on cancer risk of 10⁻⁶.

RSL value for 1,4-dichlorobenzene used for 1,3-dichlorobenzene.

RSL value for 2-chlorophenol used for 2-nitrophenol.

RSL value for 2-nitroaniline used for 3-nitroaniline.

RSL value for methoxychlor used for 4-Chlorophenyl-phenylether.

RSL value for Nitrobenzene used for 4-Nitrophenol.

RSL value for acenaphthene used for acenaphthylene.

RSL value for pyrene used for benzo(g,h,i)perylene.

RSL value for diethyl phthalate used for dimethyl phthalate.

APPENDIX H - Human Health Risk Assessment Methodology

Attachment H-5, Table 4

Comparison of Non-detected Results to Screening Levels - Surface Water

Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

Chemical	CAS	No. of Analysis	Units	Min ND	Max ND	EPA RSL	Max ND > EPA RSL
----------	-----	-----------------	-------	--------	--------	---------	------------------

RSL value for anthracene used for phenanthrene.

RSL value for trivalent chromium used for total chromium.

RSL value for mercuric chloride (and other mercury salts) used for mercury.

RSL value for chlordane used for alpha-chlordane.

RSL value for technical-HCH used for delta-BHC.

RSL value for endosulfan used as surrogate for endosulfan I.

RSL value for endosulfan used for endosulfan II.

RSL value for endosulfan used for endosulfan sulfate.

RSL value for endrin used for endrin aldehyde.

RSL value for endrin used for endrin ketone.

RSL value for chlordane used for gamma-chlordane.

RSL value for 1,3-dichloropropene used for cis-1,3-dichloropropene

RSL value for cis-1,2-dichloroethene used for total-1,2-dichloroethene.

RSL value for 1,3-dichloropropene used for trans-1,3-dichloropropene.

ug/L = microgram per liter

NA = not available

ND = Non-detect

RSL = Regional Screening Level

Attachment H-6

Screening Using New Jersey Soil Remediation Standards

[1] Maximum concentration is used for screening.

[2] Background soil values are the 95% upper tolerance limit with 95% coverage (95/95 UTL) for the dredge spoil areas (DSAs).

[3] NJDEP Residential Direct Contact Soil Remediation Standard (SRS), September 2017.

[4] Rationale Codes

Selection Reason: Above Screening Levels (ASL)

Deletion Reason: No Toxicity Information (NTX)

Essential Nutrient (NUT)

Below Screening Level (BSL)

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/

To Be Considered

BEQ = Benzo(a)pyrene equivalent

J = result is estimated

J - = result is estimated, biased low

mg/kg = milligram per kilogram

NA = Not available

V = Detected Value

[1]

Maximum concentration is used for screening.

[2]

Background soil values are the 95% upper tolerance limit with 95% coverage (95/95 UTL) for the dredge spoil areas (DSAs).

[3]

NJDEP Residential Direct Contact Soil Remediation Standard (SRS), September 2017.

[4]

Rationale Codes

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: No Toxicity Information (NTX)
Essential Nutrient (NUT)
Below Screening Level (BSL)

COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/
To Be Considered
BEQ = Benzo(a)pyrene equivalent
J = result is estimated
J + = result is estimated, biased high
mg/kg = milligram per kilogram
NA = Not available
V = Detected Value

TABLE 2.3
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN
Former Raritan Arsenal - Areas 6, 6A, 6B and DSA 1, Edison, New Jersey

Scenario Timeframe: Future
Medium: Sediment
Exposure Medium: Sediment

Exposure Point	CAS Number	Chemical	Minimum Concentration Qualifier	Maximum Concentration Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value	Screening Toxicity Value (2)	Potential ARAR/TBC Value	Potential ARAR/TBC Source	COPC Flag	Rationale for Selection or Deletion (3)
Sediment	75-15-0	CARBON DISULFIDE	1.0E-03 J	1.7E-02 J	mg/kg	SW0608	4 / 17	7.00E-03 - 9.80E-02	1.7E-02	NA	7.8E+03	NA	NA	No	BSL
	108-88-3	TOLUENE	2.2E-01 J	2.2E-01 J	mg/kg	SW0602	1 / 17	7.00E-03 - 9.80E-02	2.2E-01	NA	6.3E+03	NA	NA	No	BSL
	79-01-6	TRICHLOROETHYLENE	1.0E-03 J	3.0E-03 J	mg/kg	SW0613	3 / 17	7.00E-03 - 9.80E-02	3.0E-03	NA	3.0E+00	NA	NA	No	BSL

[1]Maximum concentration is used for screening.

[2]NJDEP Residential Direct Contact Soil Remediation Standard (SRS), September 2017.

[3]Rationale Codes

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: No Toxicity Information (NTX)
Essential Nutrient (NUT)
Below Screening Level (BSL)

COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/
To Be Considered
B = Analyte also detected in associated blank
BEQ = Benzo(a)pyrene equivalent
D = dilutions required to perform the analysis
J = result is estimated
J - = result is estimated, biased low
mg/kg = milligram per kilogram
NA = Not available
N = Presumptive evidence of the presence of the material
V = Detected Value

Combined DUs Weighted by Area																			

Attachment H-7. Weighted UCL Calculations
Areas 6, 6A, 6B and DSA 1, Remedial Investigation Report, Former Raritan Arsenal, Edison, New Jersey

Calculation of Weighted 95% UCLs for a Combined Decision Unit (DU) from Several Smaller DUs
Thallium in Total Soil (0-7.7 feet bgs)

Number of increments per replicate:

DU	DU Name							Number of Replicates	Weight	Arithmetic Mean	SD	CV	SE	95% UCL	
		Rep 36	Rep 37	Rep 38	Rep 39	Rep 40	Rep 41							Student's-t	Chebychev
1	Area 6	0.445	0.08	0.075	0.085			39	0.77	1.1	0.7	0.0	0.1	1.2	1.5
2	Area 6A							14	0.12	0.7	0.3	0.0	0.1	0.9	1.1
3	Area 6B							11	0	0.5	0.1	0.0	0.0	0.6	0.6

9															
10															
Combined DUs Weighted by Area								64	1.00	1.0	0.5	Low	0.1	1.1	1.3

Student's-t or Chebychev 95% UCL may be appropriate.	Recommended UCL	
	Student's t 95% UCL	1.1
The User should consult the instructions for additional guidance on which 95% UCL is recommended for specific data sets.
