Key:
BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Groundwater Sample Log

Site: Sylvania Corning FUSRAP
Well No.: PW-6-1
Sample Date: 11/10/12
Sampling Device:Wattera
Well Depth (feet TOIC):71
Screen Interval (feet TOIC): 70-72
Initial Water Level (Feet TOIC): 53.79
Final Water Level (feet TOIC):53.79
Casing Type: **PVC** Steel (circle one)
Personnel: B. Hewitt and D. Cuomo

Sample ID: PW-6-1-R2
Purge Start Time:1550
Sample Time: 1625
Final Turbidity (NTUs) : 8.9
Casing Inner Diameter (inches): 0.5
Purge Rate (ml/min):200
Purge Rate d/sampling (ml/min):200
Sample Analyses: VOCs (SW8260) Ni (SW6010B) and Total Uranium (ASTM-D5174)
2x Purge System Volume #:

Time	Purge Volume (L)	pH	Temperature (°C)	Conductivity (µs/cm)	Turbidity (NTUs)	DO (mg/L)	ORP (mV)	Water Level (ft TOIC)	Comments
1600	2	5.72	15.33	91	8.8	7.12	168.1		3 Volumes
1605	3	5.72	15.27	94	10.0	7.74	177.0

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing

Time	Purge Volume (L)	pH	Temperature (°C)	Conductivity (µs/cm)	Turbidity (NTUs)	DO (mg/L)	ORP (mV)	Water Level (ft TOIC)	Comments

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing.

Key:

BGS = Below ground surface.
°C = Degrees centigrade.
DO = Dissolved oxygen.
mg/L = Milligrams per liter
mV = Millivolts.
NTU = Nephelometric turbidity unit.
ORP = Redox potential.
ppm = Parts per million.
PVC = Polyvinyl chloride.
TOIC = Top of inner (PVC) casing.

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Long Island Ecological Services Field Office
340 SMITH ROAD
SHIRLEY, NY 11967
PHONE: (631)286-0485 FAX: (631)286-4003

Consultation Code: 05E1LI00-2015-SLI-0075 March 04, 2015
Event Code: 05E1LI00-2015-E-00075
Project Name: Sylvania Corning Fusrap Site

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having

similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

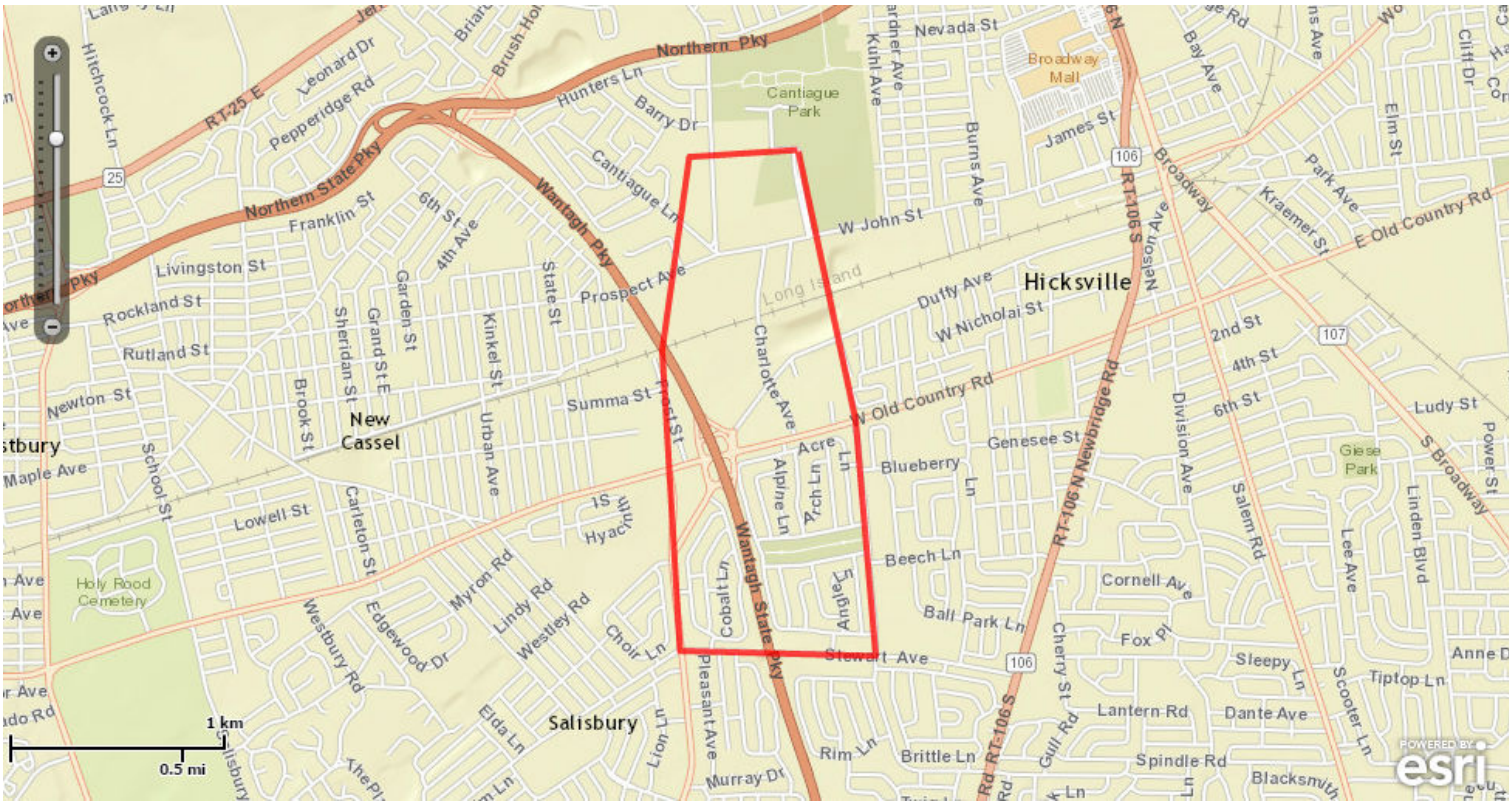
Official Species List

Provided by:

Long Island Ecological Services Field Office
340 SMITH ROAD
SHIRLEY, NY 11967
(631) 286-0485



Consultation Code: 05E1LI00-2015-SLI-0075
Event Code: 05E1LI00-2015-E-00075

Project Type: Land - Management Plans

Project Name: Sylvania Corning Fusrap Site
Project Description: The Louis Berger Group has been contracted by the United States Army Corps of Engineers (USACE) to update and ecological risk assessment for chemical contaminants at the Sylvania Corning Formerly Utilized Sties Remedial Action Program (FUSRAP) site, Hicksville, Nassau County, New York.

Please Note: The FWS office may have modified the Project Name and/or Project Description, so it may be different from what was submitted in your previous request. If the Consultation Code matches, the FWS considers this to be the same project. Contact the office in the 'Provided by' section of your previous Official Species list if you have any questions or concerns.

Endangered Species Act Species List

There are a total of 6 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the **Has Critical Habitat** column may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

Birds	**Status**	**Has Critical Habitat**	**Condition(s)**
Piping Plover *(Charadrius melodus)* Population: except Great Lakes watershed	Threatened	Final designated	
Red Knot *(Calidris canutus rufa)*	Threatened		
Roseate tern *(Sterna dougallii dougallii)* Population: northeast U.S. nesting pop.	Endangered		
Flowering Plants			
Sandplain gerardia *(Agalinis acuta)*	Endangered		
Seabeach amaranth *(Amaranthus pumilus)*	Threatened		
Mammals			
northern long-eared Bat *(Myotis septentrionalis)*	Proposed Endangered		

Critical habitats that lie within your project area

There are no critical habitats within your project area.

Introduction

Ecology and Environment, Inc., (E & E) under contract (W912DQ-06-D-0008-0003) to the United States Army Corps of Engineers (USACE), Kansas City District, has been tasked to perform a Remedial Investigation (RI) for the Sylvania Corning Formerly Utilized Sites Remedial Action Program (FUSRAP) site (Sylvania site) located in Hicksville, Nassau County, New York. The RI objectives are to:

- Fill remaining data gaps, determine source areas, and define the nature and extent of on-site contamination, including the vertical and aerial extent of the soil and groundwater contamination;
- Examine the possible exposures associated with the contamination; and
- Provide information for evaluation of alternatives available for potential future remediation of the site.

This quality control summary report (QCSR) presents the results of the sampling and analytical program and provides an opportunity to review the completeness and quality of the data collected.

The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling investigation conducted at each site (see Section 1);
- Identify any deviations from the proposed sampling and analysis procedures (see Sections 1 and 2);
- Present the analytical results for the field samples collected (see Section 3);
- Report on any inspections or audits performed and any findings that that may impact the project data (see Section 4); and
- Discuss the results of the data quality evaluation associated with the sampling events (see Sections 2 and 5).

Evaluation of any contaminants detected will be provided in separate letter reports and the RI Report. The letter reports also will contain maps of sample locations and summary tables of positive results.

Supporting information is included in appendices to the QCSR. (Note that Appendix B is available only by request due to its large size). The appendices are located on the attached DVD and include:

- Appendix A – Data Validation Memoranda (DVM) – The data validation memorandum prepared for each sample delivery group (SDG) in PDF format.

- Appendix B – Analytical Data – All laboratory reports in PDF format which include case narratives and quality control (QC) sample results. The compact disc also will include a database of the final validated data in Electronic Data Management System (EDMS) format.

- Appendix C – Sample Collection Documentation – Sample chain-of-custody (COC), daily activity summary reports, and field adjustment forms which document deviations from the planned activities. This appendix also will include any audits performed.

- Appendix D – GTEOSI Data Validation and Data Management Summary Report.

- Appendix E – CDM Data Usability Assessment Report (Phase IIIb).

1 Data Collection

Environmental samples were collected as part of the field investigation in accordance with the final RI Phase I and II Work Plan (WP) and Quality Assurance Project Plan (QAPP) for the Sylvania Corning FUSRAP site (E & E March 2007). The WP and QAPP were drafted originally for the Phase I activities, and then updated for the Phase II activities. Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; containerization of investigation-derived waste (IDW); and site surveying were performed in accordance with the WP, QAPP, and documents referenced therein. All field QC activities were carried out in accordance with the final Quality Control Plan (QCP) (E & E 2007). Field data collection activities for each phase are summarized below. Audits were performed for each phase as described in Section 4.

Quality assurance/quality control (QA/QC) samples were collected on a sitewide basis according to the criteria established in the QAPP. The field QA/QC sample requirements are as follows:

- Field QC duplicates collected at a frequency of 10% of the number of field samples collected;
- Rinsates collected at a frequency of 10% of the number of field samples collected if non-dedicated equipment was used;
- Matrix spike/matrix spike duplicate (MS/MSDs) for laboratory QC collected at a frequency of 5% of the sample collected; and
- Trip blanks sent one per shipment for each cooler in which water samples for volatile analysis were shipped. Trip blanks were analyzed for all volatile methods designated for the samples.

Any minor variances in field methodologies that occurred during the investigation are noted on the daily activity summary reports or in the field logbook. Deviations from the WP were noted on field adjustment forms. Copies of these reports and forms are provided in Appendix C. The following sections summarize the deviations and fieldwork activities for each phase of fieldwork.

1.1 Phase I Data Collection

This section of the QCSR summarizes the sampling results for:

- Phase I including: soil gas survey, indoor air and sub-slab sampling, and transformer pad sampling; and

- Phase IIa including: soil characterization at data gap borings for Building 140, Building 100, and Building 70; concrete core sampling; leach pool/drains/ drywells sampling; and test pit excavations.

Phase IIb sampling activities and additional groundwater and off-site investigations expected to be performed at a later date will be added to the QCSR as an addendum.

1.1.1 Sampling Procedures

The USACE Team performed Phase I investigations in September and November 2006. For Phase I, deviations are presented in Appendix C, summarized in the associated letter report, and listed below:

- The monitoring of concrete/soil dust and cuttings for radioactivity during installation of the active soil gas probes in Building 70 was added to aid in determining handling and disposal measures;

- Passive soil gas samplers were installed at 15 to 18 inches below asphalt/paved surfaces and maximum of 6 inches in grassy non-paved areas as per manufacturer's instructions. A 2-inch drill bit was used to install a sampler that is within manufacturer's recommended borehole size;

- Liquid crack sealer was used to backfill sub-slab sample boreholes rather than the proposed sand, providing an impermeable seal; and

- The passive soil gas network was expanded by three locations/samplers (from 86 to 89). During installation of the network, it was noted that spacing in the pre-determined grid left an almost 50-foot area without coverage on the western side (front) of Building 100. The expansion provided samples from a new location in grassy areas located along Building 100.

1.1.2 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriated laboratory according to the procedures described in the WP.

There were no deviations from the WP with regards to sample handling or sample custody.

All COC documentation associated with the collection of samples is included in Appendix C.

1.1.3 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in E & E's QAPP.

There were no deviations from the QAPP with regards to equipment calibration and maintenance.

1.1.4 Analytical Procedures

Samples were shipped to approve laboratories for analysis. Analytical methods in support of RI activities are referenced in the QAPP. VaporTec soil gas modules were provided and analyzed (modified SW-8260B) by ESN Rocky Mountain (ESN) of Golden, Colorado. Indoor air canisters were provided and analyzed by TestAmerica Laboratories, Inc. formerly known as STL Burlington of Burlington, Vermont. The indoor air laboratory also performed the polychlorinated biphenyl (PCB) analysis. Table 1-1 lists all of the analyses performed and the number of samples collected for methods for the Phase I investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-1 Summary of Analytical Methods and Samples Collected for RI Phase I, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Lab Method Description	Number of Samples Analyzed
Soil Gas	SW8260-Modified	Volatile Organic Compounds in Vapor Matrix by Ion Trap GC/MS	89

1.2 Phase IIa Data Collection

This section of the QCSR summarizes the sampling results for Phase IIa including: soil characterization at data gap borings for Building 140, Building 100, and Building 70; concrete core sampling; leach pool/drains/drywells sampling; and test pit excavations.

Phase IIb sampling activities and additional groundwater and off-site investigations expected to be performed at a later date will be added to QCSR as an addendum.

1.2.1 Sampling Procedures

The USACE team performed Phase IIa field investigations in May and June 2007. For Phase IIa, deviations are presented in Appendix C, summarized on Table 1 of the associated letter report, and listed below:

- The use of 5-foot samplers was implemented as opposed to 4-foot samplers that were in the WP. At the time the WP was written, the subcontractors were not on board. Each subcontractor has slightly different nominal sizes in their stock equipment (i.e., both 4-foot and 5-foot samplers are standard equipment). However, sample intervals remained at 0 to 8 feet, 8 to 16 feet, etc. as per the WP, regardless of the sampler length, except for two borings drilled on the first day of the field program.

- Early refusal and contaminated soils at the bottom of the borehole requiring additional drilling at a later date at several locations. This situation was relatively unavoidable as the depth of penetration was limited by the formation/fill material and capabilities of the Geoprobe equipment. Furthermore, the limited rig access also contributed to the early refusal because small hand-held units had to be used at many locations.

- Archiving the top 2 feet of soils for potential future radionuclide analyses was implemented at the start of field work to avoid the potential for any future data gaps if surface contamination needed to be assessed.

- Backfilling with grout rather than bentonite was implemented due to natural radiation levels of the bentonite. The materials potentially used for backfilling (i.e., bentonite, grout, and sand) were screened with radiation-measuring instruments, and the use of the material exhibiting the lowest radiation levels (grout) was recommended to USACE.

- Gamma spectroscopy was added to sample analyses for the concrete samples because radiological screening indicated different ratios of beta and gamma readings on different contaminated concrete samples. The use of gamma spectroscopy would more definitely eliminate (or identify) any other contaminants in the concrete.

- Fewer samples per borehole were collected than planned due to poor recovery and/or poor penetration depth.

- Locations of some shallow boreholes were adjusted based on field conditions.

- Locations of some deep borings were adjusted based on field conditions and accessibility of the actual drilling equipment.

- One boring was added at a potential sump in Building 70.

- No downhole gamma logging was performed at location DR-M because the drill rod became stuck in the borehole.

- Borehole lines were switched from 2-inch polyvinyl chloride (PVC) pipe to 1.5-inch PVC after determining in the field that 1.5-inch was sufficient to fa-

cilitate downhole gamma logging. The 2-inch PVC pipe was originally planned to ensure sufficient diameter for the downhole gamma equipment. The switch was made to the smaller diameter to improve depth of penetration and save costs.

- Rinsates were not originally planned because all the field equipment was disposable or dedicated to each sample. After review of the field procedures, it was determined that a small portion of the drilling equipment (e.g., shoe of the macro-core sampler) was decontaminated and reused and could potentially touch the sample core. Collection of one rinsate per 10 borings as opposed to one sample per 10 samples was added to evaluate the potential for cross contamination from this equipment.

1.2.2 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP. There were no deviations from the WP with regards to sample handling or custody except for the following:

- Archived samples were collected for potential future radiological analysis as noted above. The archived samples are in custody-sealed coolers under lock and key in the field office.

- The preservatives indicated on Worksheet 19 of the QAPP were incorrect for waters and soils for the metals and radiological samples. The corrections were made in the field copy. Metals and radiological water samples are preserved with nitric acid to pH of <2, not soil samples. No cooling is required for metals or radiological samples.

All COC documentation is included in Appendix C.

1.2.3 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in E & E's QAPP. There were no deviations from the QAPP with regards to equipment calibration and maintenance.

1.2.4 Analytical Procedures

Samples were shipped to approved laboratories for analysis. Analytical methods in support of RI activities are referenced in the QAPP. TestAmerica Laboratories, Inc. of St. Louis, Missouri provided all laboratory analyses for Phase IIa. Table 1-2 lists all of the analyses performed and the number of samples collected for methods for the Phase IIa investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-2 Summary of Analytical Methods and Samples Collected for RI Phase IIa, Sylvania Corning FUSRAP Site

1.3 Phase IIb Data Collection

This section of the QCSR summarizes the sampling results for Phase IIb including: soil characterization at data gap borings for Building 140, Building 100, and Building 70; leach pool/drains/drywells sampling of those not previously investigated; confirmatory borings; and test trenches.

1.3.1 Sampling Procedures

The USACE team performed Phase IIb field investigations in October and November 2007. For Phase IIb, deviations are presented in Appendix C and listed below:

- Backfilling with clean soil instead of grout was implemented at borings where drilling went through the remediation cells to obtain soil samples beneath previously excavated cells. Grout was used to top-off the borehole.

- Based on elevated field screening results and early refusal in some borings drilled during the Phase IIa investigation, it was recommended that additional drilling to deeper depths be performed during Phase IIb using different Geoprobe or drilling methods. However, after evaluating Phase IIa sample analytical data, it was determined that some of the borings with elevated PID readings had little to no VOCs, therefore, additional drilling is not warranted. In addition, based on other Phase IIa results, additional changes to the Phase

IIb scope of work have also been approved by USACE. A summary of all changes to the Phase IIb program is provided below:

- Test pits were added at the following Phase I geophysical anomaly locations: EM-1, 8 and 9 combined, 11, 13, 16, 28, 30, 31, 34, 35, and GPR-B and –C (test pits EM-1 and GPR-B were later omitted from the program as described on the next page);
- Carpet was removed from areas in B70 predominantly where carpet was installed directly on top of the concrete slab (i.e., some carpet installed over the former tile floor was inadvertently removed); and borings were drilled next to the newly discovered drains;
- Additional drilling was eliminated at SU10-02, SU-10-10, SU11-15, SU11-21, SU11-22, DR-C, DR-E, DR-R1/R2, 100-01, 100-02, 100-03, 140-01, and 140-09;
- Replaced deep drilling at SU-13 (originally planned to replace deep drilling at SU11-17/D) with deep drilling at SU11-16; and
- Additional drilling was performed at DR-J, DRH-A2, and 100-11.

■ Based on the potential to pull contaminated soils up through the clean backfill in borings C4-01/D, C6-02/D, C9-02/D, C9-03/D, and C9-04/D, it was determined to use a combination of augering and geoprobe to complete borings at these confirmatory boring locations. This was done by augering to the bottom of the excavation cell and then using the geoprobe to collect soil samples through the hollow-stem auger flights. Soil collection began from the bottom of the auger flights.

■ Some excavation cells depths varied greatly within each cell (by as much as 24 feet). Based on a review of excavation cell depths it was determined that six confirmatory borings (C1-01, C1-03, C3-01, C5-01, C5-02, and C6-03) were scheduled to be sampled well below the subcell excavation depth that these borings are to be completed in. After a discussion with USACE, it was determined that these scheduled sampling depths were too conservative for these six borings and samples collected from closer to the clean fill/native soil boundary would be more beneficial to the investigation. Collection of the continuous split-spoon samples began at 4 feet above the maximum subcell depth that the boring was to be completed in order to identify the clean fill/native soil boundary. After the field geologist identified this boundary, the confirmatory sample was collected 5 to 10 feet below that depth.

■ Test pits EM-1 and GPR-B were not excavated because it was determined that a 36-inch stormwater pipe was located at EM-1 and GPR-B is located within Cell 12, which was previously excavated and backfilled. EM-7 was added to the list on Phase IIb Field Adjustment Form 2 to provide general area coverage.

■ After completing the carpet removal task that was added to the scope of work and described in Phase IIb Field Adjustment Form 2, seven shallow borings

were completed next to eight (one co-located pair) newly identified drains (DR). These borings are termed DR-W through DR-Z, and DR-AA through DR-CC. These borings supplement the existing Leach Pool/Drain/Dry Well investigation described in Section 3.3.1 of the RI/FS Work Plan.

- Access to drain DR-Z was limited (within a small office) and could only be accessed with a jackhammer to drive geoprobe rods. The initial attempt to complete this boring on November 9 resulted in a refusal at 2 feet BGS on an apparent concrete footer. A second attempt to complete this boring deeper in an adjacent location could not be performed due to time constraints. Therefore, a sample was collected from 0 to 2 feet and sent for analysis on this day (DR-Z-Z1). This boring was again attempted on November 15 with refusal at 8 feet on natural soils. Low-level PID hits were noted in this boring, so an additional sample (DR-Z-Z1A) was collected for laboratory analysis. As a result, two samples were collected from the first 8-foot interval or zone.

1.3.2 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP. There were no deviations from the WP with regards to sample handling or custody except for the following:

- The preservatives indicated on Worksheet 19 of the QAPP were incorrect for waters and soils for the metals and radiological samples. The corrections were made in the field copy. Metals and radiological water samples are preserved with nitric acid to pH of <2, not soil samples. No cooling is required for metals or radiological samples.

All COC documentation is included in Appendix C.

1.3.3 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in E & E's QAPP. There were no deviations from the QAPP with regards to equipment calibration and maintenance. Laboratory calibration issues in regard to density of gamma standard are being investigated after completion of sample analysis. Updated SOPs for on-site field gradation monitoring equipment were in use and were identified in the field audit.

1.3.4 Analytical Procedures

Samples were shipped to approved laboratories for analysis. Analytical methods in support of RI activities are referenced in the QAPP. TestAmerica Laboratories, Inc., of St. Louis, Missouri and Knoxville, Tennessee provided all laboratory analyses for Phase IIb. Table 1-3 lists all of the analyses performed and the number of samples collected for methods for the Phase IIb investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-3 Summary of Analytical Methods and Samples Collected for RI Phase IIb, Sylvania Corning FUSRAP Site

	DOE GA-01-R	Radium by Gamma Spectroscopy	229

1.4 Phase IIIa Data Collection

This section of the QCSR summarizes the sampling results for Phase IIIa, including: vertical profile groundwater screening, soil core borings, and groundwater monitoring.

1.4.1 Sampling Procedures

The USACE team performed Phase IIIa field investigations in November 2008 through March 2009. For Phase IIIa, deviations are presented in Appendix C and listed below:

1.4.1.1 Drilling and Vertical Profile Sampling

- Using bentonite pellets in place of tremied bentonite slurry to provide monitoring well seal above the screen sand pack. Chips were poured at a slow enough rate so as not to bridge them and ensured the seal extends around the well.

- Due to high turbidity in the groundwater profile sample collected at MW-14D, radiation analysis could not be performed. This sample was replaced by one collected at MW-16D.

- Due to the presence of elevated radiation activity in the soils below the excavation cells in the area of MW-18S, samples for radiation analysis in addition to samples for VOC analysis were collected during profiling. Samples collected at MW-18S replaced scheduled samples at MW-31D.

- A shallow monitoring well (screened from 76-86 feet BGS) was installed at RI-P-39S due to elevated tetrachloroethene concentrations detected.

- During vertical profiling and well installation, the drilling exclusion zone, drill rods and soil cores were all monitored for radioactive contamination. If no contamination was detected, personnel monitoring was not required upon exiting the exclusion zone. Monitoring at routes of entry and exit to the exclusion zone was maintained. During groundwater well development and sampling, radioactive contamination monitoring was not performed.

1.4.4.2 Groundwater Sampling

- The modified water surge method (mechanically moving tubing with check valve and surge block up and down to pump out slugs of water) followed by an airlift method to remove the required water volume was used for development.. Nitrogen instead of compressed air was used for the airlift method. Additionally, a sample was collected before the introduction of nitrogen and at the end of development for quick turn VOC analysis to determine if nitrogen lift may have any impacts on GW quality.

1.4.2 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP. There were no deviations from the WP with regards to sample handling or custody except for the following:

1.4.2.1 Drilling and Vertical Profile Sampling

- Unpreserved samples were collected for Volatile Organic Analysis during the groundwater profiling. The hydrochloric acid used to preserve samples reacted with constituents in the groundwater preventing collection without zero headspace.

- Groundwater profile samples for metals analysis were collected unpreserved. Filtering of the samples was required due to the high turbidity (generally greater than 1,000 NTUs). Filtering through 0.45-micron filter, followed by preservation was performed at the American Analytical Laboratories.

- Groundwater profile samples for radiation analysis were filtered in the field using a high capacity 0.45-micron in-line filter and subsequent preservation prior to shipment. The change was added because the vertical profile samples were too turbid for analysis.

1.4.2.2 Groundwater Sampling

- All groundwater samples analyzed for radioactive constituents were filtered as a result of elevated turbidity.

- Samples MW-34D, MW-28 D, and MW-16D were filtered using a 0.45-micron filter when turbidity readings did not reduce below 50 NTUs after sta-

bilization. Unfiltered samples were also taken from these three locations and both filtered and unfiltered samples were analyzed.

1.4.3 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in E & E's QAPP. There were no deviations from the QAPP with regard to equipment calibration and maintenance with the exception of monitoring for criteria established for pH/Conductivity, Temperature, Dissolved Oxygen (DO), Oxidation Reduction (REDOX), Meter, and Turbidity. The original values listed in the QAPP were not consistent with manufacturer recommendations. Worksheet 22 in the QAPP was updated to reflect the actual values.

1.4.4 Analytical Procedures

Samples were shipped to approved laboratories for analysis. Analytical methods in support of RI activities are referenced in the QAPP. American Analytical Laboratories (AAL) of Farmingdale, NY provided volatile and metals analysis for the vertical profiling samples. GEL Laboratories of Charleston, South Carolina provided all radiological sample analysis of soils and groundwater, all groundwater, groundwater volatile organic compounds and metals analysis, and all IDW sample analysis. Table 1-4 lists all of the analyses performed and the number of samples collected for methods for the Phase IIIa investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-4 Summary of Analytical Methods and Samples Collected for RI Phase IIIa, Sylvania Corning FUSRAP Site

2 Data Analysis and Validation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, COC documents, statements in the laboratory case narratives, and field notebooks. Laboratory activities were conducted in accordance with the QAPP. The target compounds, practical quantitation limits (PQLs), and QC limits for the project were entered into the Automated Data Review (ADR) software to create a project-specific library. The evaluation of the analytical data with respect to project and method-specific quality objectives was performed through the ADR software using the results of laboratory method blank analyses, laboratory control samples (LCS), MS/MSD analyses, and surrogate recoveries, where applicable. Field duplicate and blank data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods. The final validated data was stored in an Electronic Data Management System (EDMS) format database.

E & E performed data review and validation of samples in accordance with the QAPP. The data review tasks completed for this project include:

- **ADR Set-up.** E & E set up the ADR software for all analytical parameters and QC criteria according to the QAPP. E & E provided the libraries to the project laboratory for pre-validation of their electronic data deliverable (EDD) submittals.

- **Completeness.** E & E performed a completeness check on all EDDs and compared the data to the hard copy deliverable to verify the data were reported consistently.

- **Compliance.** E & E processed EDDs using the ADR software to verify the data reported are compliant with the QAPP requirements. E & E performed an automated data validation of EDDs and generated reports of qualified data. Data that were not provided in ADR format were evaluated manually. E & E reviewed the ADR reports, checked the hard copy reports and case narratives, and verified the automated qualifiers assigned by the program. E & E reviewed calibration information and compound identification results in the raw data package and entered the ADR qualifiers. E & E reviewed the ADR

qualifiers against requirements of the current Kansas City District Data Validation guidelines as applicable (e.g., radiological only).

- **Reporting.** E & E assigned data qualifiers and flagged all reportable data. Results of the data review are summarized in the DVM in Appendix A. The DVM contains a summary of qualified data and a print out of all QC samples that did not meet control limits.

- **Data Management.** E & E developed a project-specific database with all validated data stored in EDMS format. E & E developed reporting tables in Microsoft Access format that accessed the final data in EDMS. E & E generated summary tables of final qualified data in Excel spreadsheets as shown in Section 3. Databases are provided in Appendix B.

QC samples were collected to assess the quality of the field sampling activities as described in Section 1. The evaluation of these samples was based on completeness of data, positive results of equipment and trip blank analysis, and relative percent differences (RPDs) of field duplicate results. ADR was used to evaluate field duplicates. Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DVM. The field duplicate QC criteria are 40% for aqueous samples, 70% for soil samples, and 50% for air and radiological samples. The RPD ratings are listed as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. The radiological soil and water sample results were evaluated using normalized absolute difference (NAD), which includes the uncertainty in the calculation, in addition to RPD. The NAD rating is listed as "Good" if the NAD is less than 1.96 and as "Poor" if the NAD is greater than 1.96. The NAD results are summarized in Table 4 (RAD NAD Summary Report) of the DVM. Data were qualified "J" as estimated based on the data reviewers overall evaluation of field precision and accuracy. The qualification of data because of field duplicates is discussed at the end of each DVM.

Field blanks were evaluated for each phase of sampling as described below. Field blanks were evaluated manually based on the associated samples and matrices and shipments.

The appropriate qualifiers were added to the data to indicate potential concerns with data usability. These qualifiers were transferred to the data presented on tables in Section 3. The following qualifiers were added:

J – This qualifier indicates an estimated value because the associated QC data indicated a potential laboratory or matrix problem or interference. In addition, J flags assigned by the laboratory to chemical data indicate the results are below the PQL but above the instrument detection limit (IDL) or method detection limit (MDL).

J+ – Results with a "+" have the potential for positive bias and are considered estimated.

J- – Results with a "-" have the potential for negative bias and are considered estimated.

R – The positive results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified. Negative radiochemical results with absolute values greater than their 2-sigma uncertainty were rejected in accordance with the USACE Kansas City guidance document.

U – The result is considered non-detect. The laboratory assigned this flag to analytes not present at detectable concentrations (above the IDL or MDL). The data validator assigned this flag when an analyte was considered non-detect as a result of blank contamination. If the result is above the PQL, the PQL is considered elevated.

UJ – The non-detect value is considered estimated.

UR – The non-detect results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified.

The following sections summarize the data evaluation for each phase of fieldwork.

2.1 Phase I Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DVM was generated for each SDG reported and a copy of the DVM is included in Appendix A. The results were checked for completeness and are included in Appendix B. An index of the samples and associated SDG is provided in the beginning of the Appendix A for cross reference. Tables 1 and 2 of the DVM summarize the samples and methods included for each SDG.

Sample Delivery Groups for Phase I	Laboratory for Phase I
NY116283	STL Burlington
NY116336	STL Burlington
NY117484	STL Burlington
NY117485	STL Burlington
ESN 0609028	ESN

2.1.1 Field Data Quality Evaluation

Table 2.1-1 provides a summary of the field QC samples and the associated field samples. Table 2.1-2 provides summaries of the sample collection frequency for the field QC samples by method.

FD = Field Duplicate.

Table 2.1-2 Field QC Samples by Method for RI Phase I, Sylvania Corning FUSRAP Site

Analytical Method	Matrix	Number of Primary Samples	Number of Field Duplicates	Frequency	Number of Trip Blanks	Number of Field Blanks
8082	Soil	5	1	20%	NA	NA
8260B	AIR	89	9	10%	1	NA
TO-15 Full	AIR	32	3	10%	3	NA

Key:
NA = Not Applicable

2.1.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DVM. Field duplicate results are summarized on Table 4 of the DVM. Field duplicate results for the passive soil gas

analysis indicate a high level of variability for benzene, toluene, tetrachloroethene, and acetone. Samplers containing two sorbent wires provided by the laboratory were identified as the field duplicates. Sampling or sample handling procedures are not considered of concern because of the minimal handling by field personnel. Results indicate variability within the method. Results are considered estimated.

The field duplicate canister B70-SSA-092 was received at +0.2 Hg and results did not correspond to those of the parent sample B70-SSA-15. A canister leak was indicated. Results of this field duplicate were rejected and no qualification of the parent sample was made based on field duplicate results.

Field duplicate B70-SSA-090 results were poor, comparing better to other sample results than to those of the parent sample, B70-SSA-012. It was suspected that the canister may have been mislabeled or switched prior to analysis. An investigation of field and laboratory records did not substantiate the suspicion. Positive results for the parent and field duplicate samples are qualified as estimated.

Field duplicate results for sample B70-IA-090 show good precision. Three compounds cyclohexane, heptane, and hexane, showed a high level of variability. The non-polar nature of these solvents impacted reproducibility. Results for these compounds were qualified as estimated.

Field duplicate results for the PCB analysis indicate good precision.

2.1.1.2 Field Blanks

Field blanks were not collected because all samples were collected with disposable or dedicated equipment. Trip blanks arrived at the laboratory with the air samples. Several trace level contaminants were detected as indicated on Table 3.1-1. The associated sample results were qualified as noted in Section 2.1.2.

2.1.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DVM in Appendix A and summarized in a separate section for each analytical method described below.

Table 3 in the data validation memorandum provides a list of sample results qualified and the reason for data qualification.

2.1.2.1 Soil Gas Samples – Chemical Analysis

Method 8260B – Modified

1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, acetone, benzene, styrene, tetrachloroethene, and toluene were detected in the passive soil gas trip blank. The contamination is the same as the method blank and, therefore, related to laboratory background instead of field conditions. The sample results were qualified for method blank contamination as noted below. Associated sample results were either qualified "U" at the reporting limit, "UJ" at the concentration detected if five times below the blank value (10 times below blank value for acetone), or "J" if the concentration was five times above the blank value (10 times above blank value for acetone).

1,2,4-Trichlorobenzene, 1,2,3-trichlorobenzene, acetone, the dichlorobenzene isomers, xylene, styrene, toluene, and tetrachloroethene were detected in the method blanks for the passive soil gas analysis. Associated sample results were qualified as "U" or "J" as estimated.

Acetone recoveries were low for two passive soil gas LCSs and tetrachloroethene recovery was high for one passive soil gas LCS. These are sporadic and marginal QC failures and do not indicate analytical concerns.

Matrix duplicates were analyzed for the passive soil gas analysis by Method SW8260-modified. Positive benzene, tetrachloroethene, toluene, and acetone results for the parent samples of laboratory duplicates were qualified as estimates based on high RPD values.

2.1.2.2 Indoor and Sub-slab Air – Chemical Analysis

Method TO-15

Acetone, benzene, chloroform, chloromethane, dichlorodifluoromethane, hexane, methyl ethyl ketone, methylene chloride, toluene, and trichloroethene were detected in the sub-slab trip blank, IA-TB-01. Associated positive sample results were qualified "U."

1,3,5-trimethylbenzene, 1,3-butadiene, hexane, heptane, and 1,4-dioxane recoveries were low for some EPA Method TO-15 control samples. Bromoform and hexachlorobutadiene recoveries were high for one EPA Method TO-15 LCS. These are sporadic and marginal QC failures and do not indicate analytical concerns.

LCS duplicate analysis was performed for EPA Method TO-15. RPD values were high for 3-chloropropene, chloromethane, and vinyl chloride for one LCSD. All other RPD values were within control limits.

2.1.2.3 Soil Samples – Chemical Analysis

Method 8082

Matrix spike analysis was performed for the Method 8082 analysis. The sample required analysis at a dilution and recovery control limits were not applied.

2.2 Phase IIa Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. The SDGs are listed below. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. A DVM was generated for each SDG reported and a copy of the DVM is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DVM summarize the samples and methods included for each SDG.

Key:
NA = Not applicable.

2.2.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DVM. Field duplicate results are summarized on Table 4 of the DVM. Overall, field duplicate precision was good. RPD criteria were exceeded for five field duplicate samples. Nickel results for the parent and field duplicate samples were qualified as estimated. The tetrachloroethene RPD value for the field duplicate analysis of sample DRYH-A-Z1 was high. Results are qualified as estimated.

2.2.1.2 Field Blanks

Rinsate samples were collected at a rate of one every 10 boreholes. The bulk of the field collection equipment was disposable/dedicated equipment, however, small components of the system were decontaminated between boreholes. E & E did not anticipate collecting rinsate samples, however, during the initial sampling, the decontamination of the small component was identified. The rinsate requirement was modified to be per boring instead of per sample, due the limited exposure of the samples. Trip blanks were shipped with each set of rinsate blanks. Field blanks contained low levels of Ra-226, Ra-228, Th-230, Th-228, U-235/236, and U-238. Low levels of toluene, methylene chloride, chloromethane, and bromochloromethane were also detected. Acetone levels exceeding the calibration range were detected.

Toluene, methylene chloride, and Th-230 were consistently detected in the field blanks as noted for method blanks and are likely from a laboratory source. Acetone also was found at high levels in the later rinsates. The presence of trihalomethanes indicates a potential source of chlorinated water (possibly the water used to wash down the sampling equipment). The increase in contaminants detected in the rinsate (i.e., primarily acetone) change in concentration roughly coincides with a change in water source used for the rinsates. The water shipped from the laboratory or possibly the containers used to ship the water from the laboratory are likely the source of acetone in the rinsates not the field decontamination procedures. Acetone was not detected in the associated field samples and

was not used in the field as a decontamination agent. Deionized water used for field blanks and decontamination for the next sampling round shall be ultra pure blank water purchased from an environmental sampling supply company. The presence of these compounds in the samples should be considered potential suspect due to field or laboratory background.

2.2.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DVM in Appendix A and summarized in a separate section for each analytical method below.

Table 3 in the data validation memorandum provides a list of sample results qualified and the reason for data qualification.

2.2.2.1 Soil Samples – Chemical Analysis

Method 8260B

Toluene, methylene chloride, trichlorofluoromethane, styrene, the dichlorobenzene isomers, ethylbenzene, and xylenes were detected in method blanks at concentrations below the reporting limits. Toluene was consistently detected in the method blanks. Associated sample results were qualified "U" at the reporting limit.

Surrogate recovery was above the QC limit for most samples. Recovery was below QC limits for 18 samples. Of the 18 samples, DRH-A2-Z2, DRH-B-Z1, and SU12-21-Z2 yielded recovery for one surrogate that was below 10%. The laboratory stated recoveries outside of QC limits were a function of sample matrix effects, substantiated by reanalysis yielding similar recoveries. However, reanalysis were performed after hold time expired and raw data was not provided. Positive sample results associated with high and low recoveries were qualified "J." Non-detect results associated with low recoveries were qualified "UJ. Non-detect results associated with recoveries <10% were rejected "R."

Internal standard area responses were low for several samples. Associated positive sample results were qualified "J" and non-detect results were qualified "UJ." Responses for sample SU11-02-Z1, SU11-969-Z1 and DRH-A2-Z2 were below 10%. Results for these samples were rejected "R."

Laboratory control sample recoveries were low for chloroethane, 1,1,2,2-tetrachloroethane, 1,1-dichloroethene, carbon disulfide and 1,4-dioxane. Associated sample results were qualified "UJ." The majority of LCS outliers were due to high recovery or high LCS/LCSD RPD values.

Twenty samples were analyzed as MS/MSDs. All indicated matrix effects with recovery of several compounds outside of QC limits. Associated parent sample results were qualified based on high or low recoveries. 1,2,4-Trichlorobenzene and 1,2,3-trichlorobenzene results for SU11-04-Z1 were rejected based on no recovery.

Several sample results were qualified based on initial and/or continuing calibration criteria outliers. Non-detect results were qualified "UJ" if the calibration criteria indicated a low bias. Associated positive results were qualified "J."

Results for samples SU12-03/I-Z1 and SU08-03-Z1 were rejected based on hold time exceedance. Sample SU09-03-Z1 was reanalyzed using methanol extraction after hold time expired due to the level of tetrachloroethene present. Only the tetrachloroethene result was reported from this dilution and the result was qualified "J" due to the holding time. Re-analysis to substantiate matrix effects based on surrogate recoveries and/or internal standard area responses were performed after hold time expired.

Methods 8082

Aroclor 1260 and Aroclor 1016 results for sample SU14-11-Z1 were qualified "UJ" based on high RPD values for the MS/MSD analysis.

Methods 6010B/7471A

A number of sample nickel results were qualified "UJ" or "J" based on matrix spike recovery and RPD values for the field duplicate or laboratory MSD.

2.2.2.2 Soil Samples – Radiochemical Analysis

Many results were qualified with "UJ" based on the relationship between the result, the uncertainty, and the minimum detectable concentration (MDC). The "UJ" flag indicates that the MDC is uncertain and that the reported result is nearly indistinguishable from the MDC. In most cases, the "UJ" was applied to a result that was already "U" qualified (< MDC) by the laboratory, but not always.

The laboratory added a "J" qualifier to each result that was greater than the MDC and less than the reporting limit. Addition of this qualifier is not the convention for radiochemical data, since the uncertainty for each result is reported. The "J" qualifiers were removed from these results during the validation process.

Method EML A-01-R MOD

Several Th-230 results were "J" qualified due to peak shifting greater than 40 keV from the known energy.

A few of the samples had high uranium activity and needed to be diluted and re-extracted then recounted.

There were several instances of Th-230 method blank contamination that affected a few sample results ("J" qualified).

There were a few instances when MS/MSD and/or tracer recoveries were outside of acceptance limits, which were attributed to sample matrix effects. MS/MSD results were not qualified based on the data validation guidance.

Method EML GA-01-R MOD

The densities of 68% of the samples did not comply with the USACE guidance with respect to density of sample compared to the density of the solid standard used to calibrate the gamma spectroscopy systems. Per the guidance, 68% of the samples would have "J" qualifiers attached to their gamma results. The laboratory will procure a 2 grams per cubic centimeters (g/cc) standard and evaluate the soil density relative to the new standard. The laboratory will re-run samples under the calibration with the higher density standard. The gamma data from both runs will be compared to determine a "known" bias to the density differences. There were a few instances where an insufficient sample was received by the lab to fill the container, causing the results to be estimated with a low bias.

In several instances, the reproducibility of some of the detected radionuclides in the laboratory method duplicate was outside of the defined acceptance limits. Those gamma emitter results within the analytical batch were "J" qualified.

The gamma spectroscopy printouts reported the results in becquerel (Bq)/sample, but the certificates of analysis reported results as requested, in picocuries/gram (pCi/g). This required the validator to check the conversion calculation. This was checked on random samples after checking each result in the first few SDGs.

Method SW846 9315 MOD

This method was used for only one soil sample instead of the gamma spectroscopy method for Ra-226 analysis due to limited sample quantity.

Method SW846 9320 MOD

This method was used for only one soil sample instead of the gamma spectroscopy method for Ra-228 analysis due to limited sample quantity.

2.2.2.3 Concrete Samples – Radiochemical Analysis

Method EML A-01-R MOD

Sample F6-02 required dilution and re-extraction due to high uranium activity.

Method EML GA-01-R MOD

These samples did not require any qualification for gamma analysis.

2.2.2.4 Aqueous Samples (Rinsates) – Chemical Analysis

Method SW846 6010B
No rinsate sample results for this analysis were qualified.

Method SW846 8260B
Methylene chloride, acetone, chloromethane, and bromochloromethane were detected in the equipment blanks. Acetone concentrations detected in equipment blanks identified as RB-07, RB-08, RB-11, RB-12, RB-13 and RB-14 exceeded the upper calibration range resulting in analysis of the blanks at dilutions. The water source is suspect.

Acetone, toluene, and trichloroethene were detected in trip blanks. The trip blanks may be related to both the method blank and field blank contamination.

Criteria were not met for the tuning instrument performance check associated with the 6/25/07 initial calibration. Masses 75 and 176 were affected. Samples RB-11 and RB-12 were associated with this calibration. Sample RB-07 was analyzed after the instrument performance check expired.

Several sample results were qualified based on initial and/or continuing calibration criteria outliers. Non-detect results were qualified "UJ" if the calibration criteria indicated a low bias. Associated positive results were qualified "J."

2.2.2.5 Aqueous Samples (Rinsates) – Radiochemical Analysis

Method EML A-01-R MOD
Most of the alpha results for the rinsates were qualified U or UJ, with occasional low-level detections of Th-230, Th-228, U-235/236, and U-238.

Method EML RA-06-RC MOD
Most of the Ra-226 results were qualified U or UJ, with a few very low-level detections.

Method SW846 9315 MOD
Most of the Ra-228 results were qualified U or UJ, with a few very low-level detections.

2.3 Phase IIb Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. The SDGs are listed below. An SDGs is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. Samples were analyzed for volatile organic compounds by either Test America St. Louis or Test America, Knoxville. Both laboratories share a Laboratory Information Management System. Samples were logged in St. Louis with a work location of Knoxville. Knoxville performed the analysis, up-

loaded, and released the volatile data, while St. Louis performed the remainder of the analysis and reported the entire analytical lot. Knoxville scanned and posted the raw data (and any lab-generated forms) to a secure server site where St. Louis retrieved the information for inclusion in the data package. A DVM was generated for each SDG reported and a copy of the DVM is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DVM summarize the samples and methods included for each SDG.

DOE GA-01-R	Soil	209	20	10%	NA	19

2.3.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DVM. Field duplicate results are summarized on Table 4 of the DVM. Overall, field duplicate precision was good with sporadic high RPD values for nickel, methylene chloride, toluene, and radiochemistry parameters. The radiochemical results were evaluated using the normalized absolute difference (NAD) in addition to the RPD. In cases where the RPD was high, the NAD was usually within acceptance limits (≤1.96). The NAD results

are summarized in Table 4 (RAD NAD Summary Report) of the DVM. Parent and field duplicate samples associated with high RPD values were qualified as estimated.

2.3.1.2 Field Blanks

Rinsate samples were collected at a rate of one every 10 samples. The rinsates were collected from split-spoon samplers that were all purchased new by the driller for this phase of the project. Trip blanks were shipped with each set of rinsate blanks. Empty volatile vials identified as field blanks (FB) were included in nine shipments. These vials were filled at the laboratory and analyzed for VOCs. The FBs were added to address specifically the levels of contaminants in the method blanks from the previous rounds. Since no compounds of concern were found in the samples or laboratory method blank, the FB samples were not analyzed after the first few shipments.

Chloroform was detected in all rinsate blanks except one. Sporadic, low-level detections of toluene, styrene, methylene chloride, chloromethane, tetrachloroethene, and nickel were detected in some of the rinsate blanks. Similar detections were made for the associated method blanks indicating a laboratory source. Significant concentrations of benzene and chlorobenzene were detected in one rinsate blank sample (RB-06). Due to the high levels detected in the initial run, the laboratory analyzed this sample at multiple concentrations and the dilution factor correction resulted in elevated concentrations for several other detected compounds (e.g., 1,1,2-trichloroethane, 1,1-dichloroethane, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, trichloroethene, vinyl chloride, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, chloroform, methylcyclohexane, methylene chloride, o-xylene, tetrachloroethene, and toluene). Benzene and chlorobenzene were not detected in the associated on-site soil samples; therefore, this rinsate contamination has no impact on the sample results. An investigation of the laboratory raw data and logbooks does not indicate the laboratory as the source of the contaminants. An investigation of field sampling documentation does not indicate any problems or concerns. Low levels of benzene, chlorobenzene, trichlorobenzene, and dichlorobenzene were detected in some soils and field blanks. However, the possibility that the laboratory mislabeled sample containers from another project site appears likely as no significant field source could be identified.

Low levels of acetone, bromomethane, methylene chloride, and toluene were detected in the trip blanks. Levels were consistent with those detected in the laboratory method blanks.

Low levels of acetone, chloromethane, cyclohexane, methyl acetate, methylene chloride, and toluene were detected in the field blanks. Low levels of 1,2,3-trichlorobenzene, 1,2-dichlorobenzene, xylene, styrene and trichlorofluoromethane were detected in one field blank, FB-02, but were not detected on the

associated samples. Levels were consistent with those detected in the laboratory method blanks.

Low levels of uranium and thorium isotopes were detected in a few of the equipment rinsate blank samples. Levels were generally consistent with those detected in the laboratory method blanks with a few exceptions. A concentration of 2.08 pCi/L of U-233/234 was reported in rinsate sample RB-13, which was taken following decontamination of the equipment used to collect soil samples at boring locations SU12-03/I and DR-K. The samples from these borings had elevated levels of U-233/234 (maximum 63.7 pCi/g). This may indicate that the decontamination of the split spoons was incomplete. Although the split spoons were swiped with a masselin cloth and checked for radiation contamination in the field, the concentration was likely too low for detection by the field equipment. There appears to have been minimal impact on the next set of samples collected with these split spoons (SU12-04/I and DR-J). The U-233/234 results were at background levels for SU12-04/I and slightly elevated at 8.0 pCi/g for sample DR-J. In addition, a concentration of 0.51 pCi/L of U-233/234 was reported in rinsate sample RB-15, which was taken following decontamination of the equipment used to collect soil samples at boring locations SU12-12/I and SU12-11/I. The samples from SU12-11 had elevated levels of U-233/234 (maximum 41.3 pCi/g). There appears to have been minimal, if any, impact on the next set of samples collected (DR-CC, DR-Y, and DR-BB), which had U-233/234 levels ranging from 0.306 to 0.66 pCi/g.

2.3.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DVM in Appendix A and summarized in a separate section for each analytical method below.

Table 3 in the data validation memorandum provides a list of sample results qualified and the reason for data qualification.

2.3.2.1 Soil Samples – Chemical Analysis

Method 8260B

Acetone, methylene chloride, toluene, and the dichlorobenzene isomers were detected in the method blanks analyzed by TestAmerica St. Louis at concentrations below the reporting limits. Acetone, methylene chloride, 2-butanone, bromomethane, carbon disulfide, chloromethane, 1,2,4-trichlorobenzene, 1,2,3-trichlorobenzene, 1,2-dibromo-3-chloropropane, and toluene were detected in the method blanks analyzed by Test America Knoxville and concentrations were below the reporting limit. Associated sample results were qualified "U" at the reporting limit. Most samples were qualified for methylene chloride, carbon disul-

fide, and toluene at levels near the reporting limit. Some samples were qualified for trace levels of trihalomethane typically found in potable water.

Surrogate recovery was outside of QC limits for 53 samples. For one sample, DR-Z-Z1 recovery was 0% for surrogates 4-bromofluorobenzene and dibromofluoromethane. The laboratories substantiated matrix effects by reanalysis. For samples 100-06/D-Z3, 100-996-Z1, and LPH-C/D-Z1 results of the initial analysis are reported even though the reanalysis yielded improved surrogate recoveries. Results of the initial analyses correspond to those of adjacent samples. The reanalysis of DR-Z-Z1 was performed after hold time expired. Positive sample results associated with high and low recoveries were qualified "J+" or "J-." Non-detect results associated with low recoveries were qualified "UJ." Non-detect results associated with recoveries <10% were rejected "R." A second sample was collected from the Z1 interval at boring DR-2. Surrogate recovery was acceptable.

Internal standard area responses were low for eight soil samples. Associated positive sample results were qualified "J" and non-detected results were qualified "UJ." For sample C11-01-Z7 internal standard response for the initial analysis was -100%D, resulting in high detected concentrations. Responses for the reanalysis were within the acceptable range. Results are reported from the reanalysis of C11-01-Z7.

Laboratory control sample recovery was low for methyl acetate. Associated sample results were qualified "UJ." The majority of LCS outliers were due to high LCS/LCSD RPD values.

Ten samples were analyzed as MS/MSDs. Eight indicated matrix effects with recovery of several compounds outside of QC limits. Associated parent sample results were qualified based on high or low recoveries.

Several samples were qualified based on continuing calibration criteria outliers that indicated a low bias. Non-detect results were qualified "UJ" and associated positive results were qualified "J" or "J-."

Selected results for samples DR-BB-1/2-Z1, DR-BB-1/2-Z2, DR-X-Z2, and EM-35-SO-01 were qualified "UJ" or "J-" due to hold time violations. The samples were either reanalyzed or analyzed at dilutions after hold time expired. All initial analysis was completed within holding times.

Method 6010B

A number of sample nickel results were qualified "UJ" or "J" based on matrix spike recovery.

2.3.2.2 Soil Samples – Radiochemical Analysis

Method DOE GA-01-R Mod

Approximately 55% of the gamma spec results were J qualified because the sample density was not within 70-130% of the calibration standard density (1.50 g/cc). The laboratory has purchased a new gamma standard with a density that is appropriate for the majority of the Phase IIb soil samples (2.0 g/cc). Twenty selected samples have been reanalyzed using the new standard and the results for most of the gamma emitters are presented on Table 2.3-3. An evaluation of the ratio of the original result to the new result (see Table 2.3-3) shows that most of the gamma emitters did not show any systematic bias (i.e., the ratios were both greater than and less than 1). Gamma emitters, Pb-214 and Th-234, are possible exceptions. For each gamma emitter, the original and re-calibrated results were plotted and evaluated with a linear regression. Pb-214 and Th-234 original and re-calibrated results demonstrated good correlation and showed that the reanalysis results were slightly higher than the original ones. The higher results are consistent with the anticipated bias for a high density sample analyzed against a lower density standard because gamma emissions are shielded and/or reabsorbed to a greater extent as the sample density increases.

Several gamma spectroscopy results were qualified with UJ because of the relationship between the result, the MDC, and the uncertainty. Most of these were originally U qualified and the J was added because the MDC was considered inexact and the result was near the MDC. The qualified results are listed in the Qualified Rad Detail portion of Table 3 in the DVM.

Method DOE A-01-R Th

There were several Th-230 peaks with energies that were shifted more than 40 keV from the known energy. Those Th-230 results were J qualified. Some of the apparent shifts were due to manual integrations that were not updated properly and the actual energies were correct; those results were not qualified.

Several Th-230 results were qualified for blank contamination that may have been due in part to the Th-229 tracer peak tailing. The Th-229 tracer peak is adjacent to the Th-230 peak.

A few instances of poor Th-229 tracer recoveries necessitated sample repreparation and reanalysis, with insufficient sample remaining to meet the reporting limits.

Several thorium results were qualified with UJ because of the relationship between the result, the MDC, and the uncertainty. Most of these were originally U qualified and the J was added because the MDC was considered inexact and the result was near the MDC. The qualified results are listed in the Qualified Rad Detail portion of Table 3 in the DVM.

[1] Ratio of result vs. 2.0 g/cc standard to result vs. 1.5 g/cc standard.

[2] Result is less than the MDC.

[3] Reanalysis results using gamma calibration standard with density = 2.0 g/cc are bolded.

Method DOE A-01-R U

A few instances of poor U-232 tracer recoveries necessitated sample reprepara-tion and reanalysis, with insufficient sample remaining to meet the reporting lim-its. This only occurred with rinsate samples and did not impact data usability.

Several uranium results were qualified with UJ because of the relationship be-tween the result, the MDC, and the uncertainty. Most of these were originally U qualified and the J was added because the MDC was considered inexact and the result was near the MDC. The qualified results are listed in the Qualified Rad Detail portion of Table 3 in the DVM.

2.3.2.3 Aqueous Samples (Rinsates) – Chemical Analysis

Method 8260B

As listed in Section 2.3.1 several compounds were detected at low concentrations in the rinsate samples. Significant concentrations of benzene and chlorobenzene were detected in RB-06.

Trace levels of 1,2,4-trichlorobenzene, acetone, bromomethane, carbon disulfide, chloromethane, methylene chloride and toluene were detected in the associated method blanks.

Rinsate blank 1,2,4-trichlorobenzene, 1,2-dibromo-3-chloropropane, 1,4-dioxane, cis-1,3-dichloropropene, chloromethane, bromomethane, methyl tert-butyl ether, and methyl acetate results were qualified "UJ" or "J" based on LCS recovery or LCS/LCSD RPD values outside of QC limits.

Several samples were qualified based on continuing calibration criteria outliers that indicated a low bias. Non-detect results were qualified "UJ" and associated positive results were qualified "J."

2.3.2.4 Aqueous Samples (Rinsates) – Radiochemical Analysis

Methods DOE A-01-R Th and DOE A-01-R U

There were a few instances where the recorded rinsate blank sample volumes for alpha spectroscopy were suspect; the laboratory was uncertain of the actual vol-ume analyzed. The laboratory decided that reanalysis was necessary, however, such a small volume of sample was left that the detection limits were elevated above the reporting limit.

Method DOE RA-06-RC Mod

The Ra-228 result for water sample RB-14 was rejected because the absolute value of the negative result was larger than the uncertainty; which makes the en-tire range of possible values negative.

2.4 Phase IIIa Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDGs is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. In order to accommodate the quick turnaround time for the vertical profile samples, American Analytical Laboratories grouped samples by daily delivery or by requested turnaround time.

Results of vertical profile volatile and metals screening analysis performed by American Analytical Laboratories and the vertical profile radiological analysis performed by GEL Laboratories were verified for completeness and the presence of any significant quality issues. Individual data validation memos were not generated. DVMs were generated for the soil and groundwater sample volatile, metal and radiological analysis performed by GEL Laboratories and a copy is included in Appendix A.

2.4.1.1 Field Duplicates

Soil Samples

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DVM. Field duplicate results are summarized on Table 4 of the DVM. Overall soil sample field duplicate precision for all chemical parameters was good except for calcium, cobalt, lead, nickel, and tetrachloroethylene results for sample RI-SB-16-NS. Sample non-homogeneity is suspected and the results were qualified as estimated.

Overall soil sample field duplicate precision for all radiochemical parameters was good except U235/236 for sample RI-SB-06-NS. Sample non-homogeneity is suspected and the results were qualified as estimated.

Vertical Profile Groundwater Samples

Field duplicates were submitted blind to the laboratory. Overall, field duplicate precision for volatile analysis was good except for ethyl acetate results for samples MW-13D-VP12 and MW-13D-VP19. The high RPD values for this compound are common due to its poor purging efficiency. Metals field duplicate precision shows greater variability, particularly for aluminum, iron, and manganese. Parent and field duplicate samples associated with high RPD values were qualified as estimated.

Overall, field duplicate precision for radiochemical analysis was good except Ra-228 results for sample MW-24D-VP20. The limited sample volume for the field duplicate sample MW-24D-822 was consumed during reanalysis and a much smaller volume was analyzed compared with the parent sample. Parent and field duplicate samples associated with high RPD values were qualified as estimated.

Groundwater Samples

Overall, field duplicate precision for all chemical parameters was good except for several sample MW30D-GW metals results. The affected metals – barium, cobalt, iron, manganese, nickel, potassium, sodium, and zinc – indicate that the presence of particulates may have influenced results. Results for these metals were qualified as estimated.

Overall, field duplicate precision for all radiochemical parameters was good.

2.4.1.2 Field Blanks

Soil Samples

Rinsate samples were collected at a rate of one every 10 samples. The rinsates were collected from split-spoon samplers that were all purchased new by the driller for this phase of the project. Trip blanks were shipped with each set of rinsate blanks and analyzed for volatile organic compounds.

Two rinsate blanks associated with vertical profile soil samples were collected and analyzed for volatile organic compounds. Common laboratory contaminants of methylene chloride and acetone, trihalomethanes, and toluene were detected. Three rinsate blank samples associated with the vertical profile soil samples were collected and analyzed for metals. Calcium, sodium, and zinc were detected in all three rinsate blanks. Magnesium, manganese, iron, cobalt, and potassium were also detected in at least one of the rinsate blanks.

Three rinsate blank samples associated with the vertical profile soil samples were collected and analyzed for radiochemical constituents. Thorium isotopes were not detected in any of the rinsates. Low levels of uranium isotopes (near the reporting limit), radium 228, and total alpha radium were detected below the reporting limit in one rinsate blank.

Trace levels of methylene chloride and chloromethane were detected were detected in both trip blanks and are considered to be laboratory introduced. Methylene chloride results for samples RI-SB-05-NS, RI-SB-09-NS, RI-SB-15-NS and RI-SB-22-NS were qualified "U" as not detected at the reporting limit.

Vertical Profile Groundwater Samples

Rinsate blanks were collected and analyzed at each borehole. Isolated, low-level detections of target compounds, including 4-methyl-2-pentanone, tetrachloroethene, and toluene were made.

Drill water samples were analyzed and found to contain trihalomethanes, indicating a treated water source.

Low levels of aluminum, calcium, iron, magnesium, potassium, and sodium were detected in all rinsate blanks. In addition, antimony, barium, chromium, copper, manganese, nickel, and zinc were detected sporadically.

Aluminum, barium, calcium, iron, magnesium, potassium, sodium, and zinc were detected in all drill water samples. Copper, lead, and manganese were also detected in the 11/2/008 drill water sample

Groundwater Samples

Trip blanks accompanied each groundwater sample shipment. No target compounds were detected.

2.4.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified and summarized in a separate section for each analytical method below.

2.4.2.1 Soil Samples

Method 8260B

No target compounds were detected in the laboratory method blanks associated with the soil samples.

Surrogate recovery was low for one soil sample, RI-SB-27-NS. As required, the sample was reanalyzed with acceptable recovery but after hold time had expired.

The laboratory reported results from the initial analysis. All results were qualified as estimated. Surrogate recovery was high for one trip blank, TB-02. No results were qualified.

Internal standard area responses were low for three samples. All were reanalyzed after hold time had expired with acceptable responses. The initial results for samples RI-SB-11-NS and RI-SB-09-NS were reported by the laboratory and were qualified as estimated. Internal standard area responses were extremely low for the initial analysis of sample RI-SB-15-NS. Results qualified as estimated from the reanalysis were reported.

2-Hexanone recovery exceeded control limits for one laboratory control sample. This compound was not detected in any associated sample. Therefore, no data qualification was necessary.

Two samples were analyzed for volatile MS/MSD analysis. Both exhibit matrix effects with recovery of several compounds outside of control limits. Bromoform and 1,1,2-trichloroethane results for sample RI-SB-17-NS were rejected based on recoveries of less than 10%.

Several samples were qualified as estimated "UJ" or "J" based on calibration criteria outliers. Compounds of concern were not affected.

Results for three samples were qualified as estimated based on hold time violations. Samples –RI-SB-29-NS and RI-SB-30-NS were analyzed after hold time expired due to a laboratory scheduling oversight. Sample RI-SB-05-NS required reanalysis after hold time expired due to poor internal standard area responses.

Method 6010B/7471

Trace levels of sodium, potassium, nickel, vanadium, and zinc were detected in the metals method blanks. No field sample results required qualification based on the associated method blank concentrations. A rinsate (S-RB-05) vanadium results was qualified "U," as not detected at the reporting limit. Trace levels of metals were also detected in calibration blanks but no qualification was required based on the associated sample results.

Six total metals MS/MD analysis and seven mercury MS/MD analysis were performed. Results for several elements were qualified as estimated based on recovery and RPD outliers. Control limits were not applied for all elements since sample concentrations exceeded spike amounts by more than four times.

HASL-300 Alpha Spec Thorium, Solid

Several Th-230 and Th-232 results were qualified with a "J" due to apparent method blank contamination; most likely the laboratory did not count the method blank long enough to meet the required criteria.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

HASL-300 Alpha Spec Uranium, Solid

The batch MS/MSD recoveries were below the acceptance limit for U-238, resulting in "J" qualifiers for the U-238 results for six samples.

A few samples were re-prepared using smaller aliquots due to high activity.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

HASL-300 Gamma Spec, Solid

Some gamma results for the U-238 and Th-232 decay chains were not identical to the corresponding uranium and thorium alpha spec results due to the better accuracy and precision of the alpha spec methods. No results were qualified on this basis.

Several negative results were qualified with an "R" because their absolute value was greater than their uncertainty.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

2.4.2.2 Vertical Profile Samples

Method 8260B

Methylene chloride was detected in all laboratory method blanks and at similar concentrations in all screening samples, indicating that this compound was introduced to the sample at the laboratory. All vertical profile methylene chloride results were qualified "U" as not detected at the reported concentration.
Methylene chloride recovery was high for one laboratory control sample. Since all sample methylene chloride results were qualified "U" based on method blank concentrations, no additional qualification was required.

The laboratory documented calibration criteria outliers for several compounds. None were major compounds of concern.

MS/MSD samples were collected at a frequency of one per 20 samples. Sporadic low recoveries and high RPD values were reported. No data quality issues were indicated based on the MS/MSD results.

Method 6010B/7470A

A trace level of magnesium was detected in one metals method blank.

Recovery of several metals, predominantly the anions and iron, was outside of control limits. In some instances, control limits were not applicable since sample concentrations exceeded the spike amount by more than four times. Data quality issues were not indicated.

HASL-300 Alpha Spec Thorium, Liquid

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

HASL-300 Alpha Spec Uranium, Liquid

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

A few detection limits exceeded the reporting limit, however, the sample results were above the detection limits and data usability was not impacted.

For a few high-activity samples the spike activity was lower than the sample activity and the spike recovery was not applicable. This had no impact on data usability.

Method 903.0, Total Alpha Radium

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

Method 904.0, Radium-228 in Drinking Water

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

2.4.2.3 Groundwater Samples

Method 8260B

Trace levels of volatile target compounds were sporadically detected on the method blanks. The methylene chloride concentration for only one sample, MW23D-GW, required qualification as not detected based on the associated method blank level.

One MS/MSD outlier was reported. Recovery of bromodichloromethane was above control limits for the MSD analysis of sample MW17S-GW. The compound was not detected in the parent sample and no qualification was required.

Dichlorodifluoromethane recovery exceeded control limits for the second source calibration standard and continuing calibration standards. This compound was not detected in the samples and no data qualification was needed. Continuing calibration criteria resulted in a low bias for isopropylbenzene for one standard and associated sample results were qualified as estimated, not detected.

Method 6010B/7470A

Potassium, sodium, and zinc were detected in several method blanks. Potassium and sodium were also reported as positive detections or as negative readings for several calibration blanks. Several zinc sample results were qualified as not detected at the PQL based on the method blank concentrations.

Six MS/MSD analyses were performed for metals analysis. Recoveries of calcium and sodium were outside of control limits but qualification was not appropriate since sample concentrations were more than four times the spike amount added.

ASTM D5174, Total Uranium in Drinking Water

A few samples were re-prepped and/or re-analyzed due to high or low recovery.

Sample MW31D-GW was qualified with a "J" due to method blank contamination.

Sample MW 25D-GW was reanalyzed for total uranium at E & E's request because the alpha spec uranium results did not add up to even half that activity. The reanalysis result is being reported. The original analysis was performed immediately following a high uranium activity sample and instrument carryover or laboratory cross contamination is suspected to be the cause of the high original result.

HASL-300 Alpha Spec Thorium, Liquid

A few samples were re-prepped and/or re-analyzed due to high or low recovery.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

HASL-300 Alpha Spec Uranium, Liquid

A few samples were re-prepped and/or re-analyzed due to high or low recovery.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

Method 900.0, Gross Alpha Beta in Drinking Water

A few gross alpha results were qualified with a "J" because the MS/MSD accuracies were outside of acceptance limits.

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

Samples MW-32D-GW and MW 34D-GW-U were reanalyzed for gross alpha at E & E's request because the results were much greater than the summed alpha spec activity. The reanalysis results are being reported. The laboratory noted inhomogeneity of solids between the sample aliquots likely explain the differences.

Method 901.1, Gammaspec, Gamma, Liquid

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

Method 903.1, Radium-226 in Drinking Water

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

A few results were qualified with a "J" because although the MS/MSD accuracy was acceptable, the precision was not acceptable.

Method 904.0, Radium-228 in Drinking Water

Several results were qualified with a "UJ" because of the relationship between the result, uncertainty, and detection limit.

Several samples were post-spiked to confirm nondetects and to eliminate the possibility of quenching.

Several samples were re-analyzed due to bubbles forming inside of the instrument tubing.

3 Data Summaries

Tables summarizing the complete results for the site samples are provided in this section. Tables summarizing the positive results only are provided in the associated data summary reports submitted under separate cover. Field duplicate results are presented along with the field samples. Table 4 in the DVM presented in Appendix A reports the RPDs for the field duplicates. The ADR outlier reports provided as an attachment to the DVM provide a summary of positive results for the QC samples outside QC criteria including positive results for method blanks and the associated data qualifiers.

Complete analytical results are provided in databases in Appendix B.

The following sections provide data tables for each phase of field work.

3.1 Phase I Data Summaries

Tables 3.1-1 through 3.1-6 include complete analytical results for Phase I investigations conducted in September and November 2006. Summary of positive results are provided in the associated letter report.

3.2 Phase IIa Data Summaries

Tables 3.2-1 through 3.2-4 include complete analytical results for Phase IIa investigations conducted in May and June 2007. Summary of positive results are provided in the associated letter report.

3.3 Phase IIb Data Summaries

Tables 3.3-1 through 3.3-4 include complete analytical results for Phase IIb investigations conducted in October and November 2007. Summary of positive results are provided in the associated letter report.

For samples for VOCs, the analysis was split between TestAmerica St. Louis and TestAmerica Knoxville to maintain capacity for the field sampling schedule. The laboratories did not have the exact same sample list.

None of the compounds that were different between the laboratories were compounds of concern at the site. The compounds were not detected in the samples.

3.4 Phase IIIa Data Summaries

The complete analytical results for Phase IIIa investigations (and for Phases I and II) are provided in the newly developed interactive database on the provided disk. Therefore, data summary tables for Phase IIIa are not provided in this report.

Key for Tables 3.2-1 through 3.2-4

Key:

-- = No Data Reported
J = Estimated
J+ = Estimated Biased High
J- = Estimated Biased Low
U = Not Detected
UJ = Not Detected/Estimated
UR = Lab Non Detect Rejected by Validator
mg/kg = milligram per kilogram
mg/kg = microgram per kilogram
pCi/g = picocuries per gram
Qual = Qualifier
MDC = Minimum Detectable Concentration
BGS = Below Ground Surface

Alpha Spectroscopy

Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R

Gamma Spectroscopy

All other Radionucleides- DOE-GA-01-R

(1) = 100-10-931-Z2 was resampled for VOCs on 09/15/2007
(2) = SU10-977-Z1 was resampled for VOCs on 09/18/2007
(3) = Sample was not analyzed for VOCs
(4) = 100-10-Z1 and 100-10-Z2 were resampled for VOCs on 6/15/2007
(5) = SU08-07-Z1 and SU08-07-Z2 were resampled for VOCs on 6/14/2007
(6) = SU08-08-Z1, SU08-08-Z2, SU08-12-Z1, and SU08-12-Z2 were resampled for VOCs on 6/15/2007
(7) = SU09-02-Z1,SU09-03-Z2, and SU09-13-Z2 were resampled for VOCs on 6/12/2007
(8) = SU14-12-Z2 was resampled for VOCs on 6/1/2007
(9) = SU10-03-Z1 was resampled for VOCs on 06/18/2007
(10) = SU10-11-Z1, SU10-11-Z2, SU10-15-Z1, SU10-15-Z2, SU10-19-Z1, and SU10-19-Z2 were resampled for VOCs on 06/14/2007
(11) = Radium-226 was identified and quantified using the Bismuth-214 peak.
(12) = Radium-228 was identified and quantified using the Actinium-228 Peak.
(13)=Phase I Geophysical Anomalies
(14)=Piece of Slag, Uranium, Thorium, and Radium analyzed by alpha spectroscopy DOE-A-01-R
(15) = Soil Samples taken from Concrete Core Locations

Key for Table 3.3-1a

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key forTable 3.3-1b

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-2a

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-2b

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-3a

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3b

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3d

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3e

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3f

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3g

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern

Key for Table 3.3-3h

Key:
U = Not Detected
UJ = Not Detected/Estimated
J = Estimated Value
J+ = Estimated Biased High
J- = Estimated Biased Low
R = Rejected
UR = Not Detected by Lab, Rejected by Validator
mg/kg = milligram per kilogram
µg/kg = microgram per kilogram
mg/L = milligram per liter
µg/L = microgram per liter
ft = feet
VOCs = Volatile Organic Compounds
Bolded values represent positive results for target compounds
-- = No Value Reported
1 = Samples analyzed at TA Knoxville were analyzed using a different sample list, not a contaminant of concern
