Key for Table 3.3-4c

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-4d

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-4e

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-4f

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key forTable 3.3-4g

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

Key for Table 3.3-4h

Key:
-- = No Data Reported
J = Estimated
U = Not Detected
UJ = Not Detected/Estimated
pCi/g = picocuries per gram
pCi/L = picocuries per liter
Unc. = Uncertainty
Qual = Qualifier
MDC = Minimum Detectable Concentration
ft = feet
Alpha Spectroscopy
Uranium 233/234, 235/236, 238- DOE-A-01-R
Thorium 228, 230, 232- DOE-A-01-R
Gamma Spectroscopy
All other Radionuclides- DOE-GA-01-R

Notes:

[1]Radium-226 was identified and quantified using the Bismuth-214 peak.

[2]Radium-228 was identified and quantified using the Actinium-228 peak.

This page intentionally left blank.

4 System Audits

Audits were scheduled for the sampling phase for this project. Audits are summarized in Table 4-1 and included in Appendix C. In addition to the field audits, a laboratory site visit was performed for the Phase IIa activities. A follow-up laboratory audit was conducted on October 30, 2007. A copy of the audit plan is provided in Appendix C.

Table 4-1 Summary of System Audits

Audit Dates	Company	Scope of Audit and Summary of Findings
9/12-13/2006	E & E	Audit of Phase I field investigations. Minor deviations from the WP were noted and corrected.
5/16-17/07	E & E	Audit of Phase IIa field investigations. Minor deviations from the WP were noted and corrected. Rinsate samples were added due to small section of the macro-core sampler that was non-dedicated equipment and corrections made to the chemical preservatives in the QAPP.
5/21/07	E & E	Onsite visit and review of project specific operations at TestAmerica Laboratories, Inc. (formerly STL St. Louis) in St. Louis, Missouri. Immediate corrective actions for analysis of soil volatile organic compounds (VOCs) to ensure the samples were not opened. A small sample was used for the nickel sample so the aliquot was taken from the homogenized sample for radiological analysis. Clarifications for project work were documented in an internal memo.
10/30/07	E & E	Follow-up audit at TestAmerica Laboratories, Inc., in St. Louis, Missouri. Evaluate laboratory implementation of Phase IIb required actions in response to Phase IIa non-conformance issues. A copy of the audit summary memo, including responses from TestAmerica St. Louis, is provided in Appendix C.
10/18-19/07	E & E	Audit of Phase IIb field investigations. Minor deviations from the WP were noted and corrected. Decontamination procedures were modified and noted. Field teams instructed to label sample jar lids with ID numbers and to ensure use of plastic or other clean material when handling samples.
11/5/08	E & E	Laboratory audit of American Analytical Laboratories, Inc. The changes in sample preservation for VOCs and metals were reviewed and the appropriate laboratory SOPs put into practice (VOCs unpreserved, 7-day hold time; dissolved metals, sample filtration, no digestion). The laboratory modified VOC MDLs now comply with low level standard per NELAC; QAPP will be updated. Low trend for trihalomethanes examined; blind PE samples within limits; no further action needed. Clarifications to SOPs were recommended. Improvements in sample courier delivery were recommended.

Table 4-1 Summary of System Audits

Audit Dates	Company	Scope of Audit and Summary of Findings
11/5-6/08	E & E	Field audit of Phase IIIa field investigations, rotosonic drilling. Sample handling procedure modifications determined necessary due to sample matrix effects were made to the work plan documents and put into practice (stop acid preservation of VOC and metals samples due to effervescence in contact with acid). Minor deviations from the WP were noted and corrected. Field team was instructed to provide rinsate samples of equipment using King Lubricant and to record description of type of sampler on drill rig for each well. Field team instructed to record tracking numbers on COC and sample log. Cabrera SOPs were requested for verification because they were not on site; SOPs were provided and reviewed; updates need to be included in QAPP. Instrument calibration criteria and log sheet for pH, ORP, and turbidity need review and possible revision in QAPP.
11/12/08	E & E	Laboratory audit of GEL Laboratories, LLC. The changes in sample preservation for VOCs and metals were reviewed and the appropriate laboratory SOPs put into practice (VOCs unpreserved, 7-day hold time; dissolved metals, sample filtration, no digestion). Sample filtration for radium analyses required – drinking water methods are being used. Specific SOPs for radiological analyses were reviewed and clarification was made as to which SOPs would be used; the QAPP will be updated to include the appropriate SOPs. The laboratory energy and efficiency calibration deviation form the USACE KC guidance was reviewed and approved and the QAPP will be updated. Where laboratory acceptance limits differ from the USACE KC guidance, the laboratory will use project-specific requirements. Gamma spec soil density correction has been verified for samples within a range of 55-190 g; the laboratory will notify E & E if any sample weights are outside of the range. Recently updated laboratory MDLs have no impact on data usability and the QAPP will be updated.

5 Data Completeness and QA/QC Problems

This section summarizes the degree to which the analytical systems met or failed the data quality objectives (DQOs) listed in the QAPP. A discussion is provided for each phase of fieldwork.

5.1 Phase I Data Completeness

5.1.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.1-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 93 sample points were rejected for air analysis concerns which were a small percentage of the overall data. A total of 96% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.1-1 Qualified Data and Data Completeness for RI Phase I, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	J-	U	UJ	R	Total	Rejected
Air	TO-15	124	26	1	1370	28	51	1600	3%
	TO-15 LOW	205	15	20	292	14	42	588	7%
SO	8082	9			33			42	0%
Totals		**338**	**41**	**21**	**1695**	**42**	**93**	**2230**	**4%**

5.1.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- **Soil gas variability.** The passive soil gas had high variability that may be indicative of the methodology used. The purpose of the sampling program

was to identify hot spots and data are usable. Other data uses should be evaluated closely.

- **Suspected air canister leaks.** Canisters for samples B100-IA-03 and B70-SSA-092 (field duplicate of sample B70-SSA-015) were received under positive pressure indicating that the canisters may have leaked. Field duplicate results did not compare to the parent sample. Results were rejected.

5.2 Phase IIa Data Completeness

5.2.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.2-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.2. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 253 sample points were rejected for analysis concerns with the VOC analysis. No other sample results were rejected. Due to the significant problems with VOCs, a small percentage of the overall data was rejected and 99.1% of the data are useable. The completeness goals for the project were met based on this percentage.

Table 5.2-1 Qualified Data and Data Completeness for RI Phase IIa, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	JN	J+	J-	U	UJ	J	Total	Rejected

5.2.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures except for the concentration of acetone found in the some of the equipment blanks. The recommended changes to procedures are as follows:

- Source water for equipment rinsates should be obtained from a verifiable source. Water was provided by the laboratory for this event. Use of a higher

quality grade of water or verification prior to shipment by the laboratory should be considered by analysis of sample before use.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Hold time exceedance. The laboratory initial analyzed samples closed to the hold time limit. If the samples required reanalysis, the re-analysis was run outside of holding time. The time lag between initial analysis and reanalysis was significant, reflecting capacity or data management difficulties. When possible, samples were re-collected in the field.

- Matrix effects were significant. There are no recommended changes for problems based on sample matrix.

- Toluene was consistently detected in the laboratory method blanks at concentrations above the MDL but below the reporting limit. Toluene is not considered a common laboratory contaminant. Concentrations detected in the field samples were consistent with the method blank levels. The laboratory should consider verification of the water source or other options to eliminate toluene. None of the affected levels were above the PQL, and therefore should not impact data usability significantly.

- The laboratory is performing manual data entry as indicated by a number of inconsistencies between reporting forms used for summary and final reports and between hardcopy and EDD reports. The laboratory consistently had errors in reporting cyclohexane, dibromochloromethane and 1,1,2,2-tetrachloroethane. The laboratory was also inconsistent in reporting all matrix spike results.

- There were several instances of Th-230 MB contamination, which caused qualification of some low level samples. It is recommended that the laboratory investigate the source of the Th-230 and eliminate it, if possible.

- Some high MS/MSD and tracer recoveries occurred in soil sample alpha analysis, which was attributed to the sample matrix effect. There are no recommended changes since the problems are due to sample matrix.

- The lab raw data printout is in Bq/sample and a conversion calculation is done to derive the results in pCi/g, which are the required reporting limits. It is recommended that the laboratory investigate the possibility of their gamma spectroscopy computer system having the conversion factors entered upon sample counting and print the results in pCi/g, so that no further calculation is required.

- The alpha spectroscopy tracer recoveries were checked manually by the validator. It would be helpful if the tracer recoveries could be entered in the EDD and evaluated by ADR.

- The laboratory reported relative error ratio (RER) results for their laboratory duplicates in the EDD instead of relative percent difference (RPD). The RER is typically lower than the RPD for a given sample pair and has lower acceptance limits. This allowed results that were outside of the limits to pass through ADR without being addressed. The validator manually reviewed the RPDs and then calculated the RER for those that were questionable. It is recommended that the laboratory either include RPDs only in their EDD or, that they calculate RERs and report those for method duplicates. RER is roughly equivalent to the normalized absolute difference used in the data validation guidance.

- The laboratory qualified results that were greater than the MDC and less than the reporting limit with a "J." That is a chemical convention and is not commonly used for radiochemical data. It is recommended that the laboratory stop qualifying data this way.

5.3 Phase IIb Data Completeness

5.3.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.3-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.3. Data points that were qualified as estimated are considered useable for the purposes of this project. A total of 58 sample points were rejected for volatile and Ra-228 analysis concerns which were a small percentage of the overall data. One data point was rejected for Ra-228 analysis because of a large negative value. Fifty-seven data points were rejected for volatile analysis of one soil sample based on surrogate spike recovery. A total of 99.7% of the data are useable. The completeness goals for the project were met based on this percentage.

Table 5.3-1 Qualified Data and Data Completeness for RI Phase IIb, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	JN	J+	J-	U	UJ	R	Total	Rejected

5.3.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures except for:

- The concentrations of benzene and chlorobenzene that were found in one of the equipment blanks. Field personnel were interviewed and field logbook entries reviewed. No source of the contaminants at the site could be identified. The split-spoons that were rinsed were purchased by the drilling company and were used for the first time on this site. The same water source was used for all equipment blanks generated during this sampling phase. A laboratory investigation did not reveal any problems, but a potential sample switch at the lab with a sample from another project is suspected. Rinsate water will be monitored in the field with a PID to ensure the water is not switched.

- The failure of the field team to notify the laboratory of suspected high concentration samples at C4 resulted in analytical problems (e.g., carry-over see below). Field team members were instructed to add a note to the laboratory on PID readings.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Matrix effects were significant for volatile analysis. There are no recommended changes for problems based on sample matrix. Matrix effects are related to high concentrations of target compounds; therefore, the impact was predominantly on compounds that are not of concern.

- Initial analysis of samples C9-03/D-Z7, C9-03/D-Z8, C4-01/D-Z6, SU08-11/D-Z5, SU08-11/D-Z6, and SU08-11/D-Z7 show evidence of tetrachloroethene (PCE) carryover from sample C4-01/D-Z5. No sample available for reanalysis of SU08-11/D-Z6 and SU08-11/D-Z7; therefore, PCE results for these samples are qualified as suspect. SU08-11/D-Z5 was reanalyzed at 50-fold dilution resulting in elevated reporting limits. Therefore, results of the initial analysis of sample SU08-11/D-Z5 are reported with the PCE results qualified as suspect.

- The boring at DR-Z was advanced only to 2 feet BGS on November 9, 2007, and the 0 to 2 foot interval was sent for lab analysis. Due to the PID hit, a second sample was collected from the Z1 interval to evaluate this boring (DR-Z-Z1A). Results from both analyses are reported with non-detect results for

sample DR-Z-Z1 qualified "UR" as rejected due to <10% recovery of two surrogate compounds. Reanalysis was completed after hold time expired.

- For samples for VOCs, the analysis was split between Test America St. Louis and Test America Knoxville. The laboratories did not have the exact same compound list. Test America Knoxville did not analyze the sample for 1,4-dioxane. Both laboratories were inconsistent in the compound lists reported for the field blanks. Seven of the eleven field blank samples were not analyzed for cyclohexane, methylcyclohexane, 1,1,2,2-tetrachloroethane, and 1,2-dibromo-3-chloropropane. None of these compounds were compounds of concern at the site. The compounds were not detected in the samples.

- The number of volatile compounds detected in the Test America Knoxville laboratory blanks at concentrations above the MDL, but below the reporting limit, was significant. Many of the compounds are not considered common laboratory contaminants. The laboratory should consider verification of the water source or review instrument conditions to minimize method blanks detections. The detected levels did not impact data usability.

- There were a few instances where the laboratory decided that they needed to perform a reanalysis of rinsate blank samples. Some of the reanalyses were due to sample volumes being recorded by the analyst incorrectly and the laboratory was unable to determine the true volume used for analysis. Other instances were due to extremely low tracer recoveries, indicating the possibility that the tracer was inadvertently not added to the samples. In these cases, the rinsate blank sample volume that remained for reanalysis was inadequate for the laboratory to meet the required detection limits. The laboratory should consider the use of checklists to help the analyst be certain that the correct sample and tracer volumes have been used for analysis. Supplying the laboratory with a larger volume of rinsate blank could be considered for future events.

5.3.3 Effectiveness of Corrective Actions from Phase IIa

Gamma Spectroscopy Calibration Standard Density

The gamma spectroscopy calibration standard used to analyze the soil samples from Phases IIa and IIb had a density of 1.5 g/cc. The USACE data validation guidance directs the validator to qualify all gamma spec results if the sample density is not within 70 to 130% of the standard density. The laboratory acquisition and implementation of a gamma spec calibration standard with a density of 2.0 g/cc was not completed until after all the Phase IIb samples had been analyzed. Approximately 55% of the Phase IIb samples were J qualified on this basis. Soil samples were selected for reanalysis against the new standard to evaluate the differences in the results, if any. The selection was based on the sample density and the ratio of U-238 to Th-234 in the analytical results.

The evaluation of the results is presented in Section 2.3. The results do not indicate any systematic bias that would warrant correction of the existing data. The results of Pb-214 and Th-234 demonstrate a trend to higher concentrations in the re-calibrated results, but the bias is within generally within the analytical uncertainty.

5.3.4 VOC Sample Hold Times

The VOC samples were not always analyzed within their hold times during Phase IIa. There was an error within "Client Requirements Memorandum #4A" that allowed sample repreparation and/or reanalysis to be performed within 2 times the hold time, which is not applicable to this project. Sample repreparation and/or reanalysis are required to be performed within the sample hold time. The corrective action directed TestAmerica to evaluate their analytical capacity earlier in the process, and, if necessary, send samples to TestAmerica Knoxville for analysis within the holding time, which was effective. Missed hold times for VOC samples in Phase IIb were associated with reanalyses. All initial VOC analyses were within hold times. The corrective action is considered effective.

5.3.5 Alpha Spectroscopy Tracer Recoveries

The laboratory alpha spectroscopy tracer recovery acceptance limits are 30 to 110%. The QAPP and USACE guidance specify limits of 50 to 100%, however, the USACE guidance also allows for the use of laboratory derived limits. In most cases the recoveries were within 50 to 100% and no results were qualified on this basis. The addition of the tracer recoveries to the EDD was not implemented in time for use in Phase IIb due to illness of the laboratory programmer assigned to the task. Manual review of the tracer recoveries continued into Phase IIb.

5.3.6 Laboratory Reporting of Duplicate RPD in EDD

The laboratory corrected its EDD software program during Phase IIb to report the sample duplicate RPD instead of the RER, which allowed ADR to evaluate the duplicates in the EDDs correctly. The equation that was used to calculate the RER for TestAmerica's RadCapture program was corrected to match the E & E normalized absolute difference, which eliminated the need for E & E to calculate the RER to evaluate duplicates where the RPD was not applicable.

5.3.7 Laboratory Method Blank Contamination

The contamination of laboratory method blanks with Th-230 was investigated and found to be related to Th-229 tracer peak tailing and acceptance of blank results that are greater than half the reporting limit. "Client Requirements Memorandum #4A" was updated to include the acceptance criterion that the result must be less than half the reporting limit. The tracer peak tailing continued as an issue in Phase IIb.

Low levels of Th-230 in the samples and blanks could be suspect due to tailing. The results are significantly below background levels and are not impacting data usability.

5.4 Phase IIIa Data Completeness

5.4.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.4-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.4. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 99.1% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.4-1 Qualified Data and Data Completeness for RI Phase IIIa, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	<	>	H	J	J+	J-	U	UJ	R	Total	Rejected

5.4.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures except for:

- Two volatiles sample bottles were broken during shipment, however, the lab salvaged and analyzed the samples.

- A one-liter sample container was broken during shipment, however, there was sufficient volume of that sample in the other containers to perform all the requested analyses.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Ethyl acetate was not included in the matrix spike and laboratory control sample spike solutions associated with vertical profile water samples analyzed by AAL. This compound was not included in the target compound list for samples collected from 11/4/08 through 11/18/08. All reported ethyl acetate results are considered estimated.

- Volatile analysis hold time violations were documented. Samples RI-SB29-NS and RI-SB30-NS were analyzed two days after hold time expired due to a scheduling oversight. Sample RI-SB-15-NS was reanalyzed after hold time expired due to poor internal standard area responses. The reanalysis results were reported. Sample RI-SB-05-NS was reanalyzed at a dilution after hold time expired due to detections that exceeded the instrument's calibrated range. Sample RI-SB-27-NS was reanalyzed due to low surrogate recovery after hold time had expired; initial results were confirmed and reported with qualification of J as estimated. Hold time violations resulted in reported values qualified as estimated. Although the hold time violations do not appear to be indicative of a major laboratory problem, the laboratory failed to notify of the problems prior to final data submission. It is recommended that GEL project manager forward non-conformance reports as soon as possible to project manager or project chemist.

- Bromoform and 1,1,2-trichloroethane results for samples RI-SB-05-NS, RI-SB-25-NS, and RI-SB-22-NS were rejected based on MS recovery less than 10%.

- The laboratory did not initially report aluminum or antimony with the other TAL metals due to an inadvertent omission from their reporting template, however, they later reported all aluminum and antimony results that had been requested using the original data (the data had been acquired initially).

- GEL Laboratories' IDL study for method 6010B was performed more than one year before the analyses. No results were qualified on this basis.

- The laboratory elected to perform metals and mercury MS/MSD analyses on samples that were not designated for MS/MSD analyses on the COC, and when the MS/MSD results were not within acceptance limits, there was not sufficient sample to perform a repeat analysis.

- Some volatile compounds were not included in the LCSD. Some volatile compounds were analyzed with low area counts.

- Methylene chloride detected in trip blanks resulted in qualification of several sample results with U as not detected for methylene chloride.

- Continuing calibration criteria were not met for bromomethane, 2-butanone, and 2-hexanone, therefore these sample results were qualified with a UJ as estimated.

- Metals were detected in some of the calibration blanks, however, they were at low levels that did not require qualification of sample results.

- Antimony, mercury, sodium, and zinc were detected in some of the method blanks, resulting in qualification of some sample results as U, not detected.

- Metals MS/MSD RPDs were above the acceptance limit indicating sample nonhomogeneity, therefore sample results for antimony, calcium, iron, magnesium, and potassium were qualified with a J as estimated. MS recovery was below the acceptance limit for manganese and potassium, therefore sample results were qualified with a J as estimated. Aluminum spike recovery was above acceptance limits, therefore sample results were qualified with a J as estimated. Aluminum sample concentrations for samples spiked with aluminum were too high for the spike amount added, therefore the spike recoveries were not meaningful.

- Serial dilution recoveries for chromium and nickel did not meet acceptance criteria, therefore sample results were qualified with a J as estimated.

- Several PQLs reported for groundwater volatile analysis by GEL Laboratories exceeded those in the QAPP. MDLs were sufficiently low to meet all project targets. Efforts to improve communication between GEL project manager and E & E project chemists should be made.

- Th-230 and Th-232 were detected in method blanks above the MDC and 1-sigma uncertainty. Some sample results were qualified with a J as estimated on this basis.

- U-238 matrix spike and matrix spike duplicate results were below acceptance limits; samples were reprepared and reanalyzed with similar results, indicating a matrix interference, and sample results were qualified with a J as estimated.

- The RPD or NAD for U-235/236 for a field duplicate sample pair was above the acceptance limit, therefore the results were qualified with a J as estimated.

- The RPD or NAD for the matrix duplicate analysis for U-233/234 was above the acceptance limit, therefore the results were qualified with a UJ as estimated. The RPD or NAD for the matrix duplicate analysis for Ra-228 was above the acceptance limit, therefore the results were qualified with a J as estimated.

- The RPD for the MS/MSD analysis for radium-226 in drinking water was above the acceptance limit, therefore the results were qualified with a J as estimated.

- The MS/MSD accuracy for gross alpha were below acceptance limits, therefore the sample results for that batch were qualified with a J as estimated.

- Sample MW-18S-GW was reanalyzed for total uranium at E & E's request because the result did not agree with the alpha spectroscopy results for uranium. There appears to have been cross contamination from a high uranium sample that was analyzed immediately before MW-18S-GW in the instrument batch. The reanalysis result agreed with the alpha spec results and was reported without qualification.

- Sample MW-32D-GW was reanalyzed for gross alpha at E & E's request because the result did not agree with the alpha spectroscopy results. The laboratory noted elevated levels of sediment in the sample container, indicating non-homogeneity between the sample aliquots used for gross alpha and alpha spec analysis. The reanalysis result agreed with the alpha spec results and was reported qualified with a J as estimated because the gross alpha spike recovery was not within acceptance limits.

- Sample results for calcium, cobalt, lead, nickel, and tetrachloroethylene for sample RI-SB-16-NS were qualified with a J as estimated due to high RPDs for the field duplicate sample pair.

- Sample results for barium, cobalt, iron, manganese, nickel, potassium, and sodium for sample MW-30-D-GW were qualified with a J as estimated due to high RPDs for the field duplicate sample pair.

Section 1
Data Usability and Assessment Review

The U.S. Army Corps of Engineers tasked CDM Federal Programs Corporation (CDM) to perform a Remedial Investigation (RI) (Phase IIIb) for the Sylvania Corning FUSRAP Site Hicksville, Nassau County, New York. Specific details of the site and the investigation are discussed in the Data Summary Report (DSR) Phase IIIb, Sylvania-Corning FUSRAP Site, Hicksville, New York (CDM 2010). Samples were collected in March and April 2010.

The purpose of this data usability and assessment review (DUAR) is to summarize the data validation performed on the round 2 monitoring well samples and to determine whether the sample results meet the data quality objectives (DQOs) outlined in the Project-Specific Quality Assurance Project Plan (QAPP) for the Remedial Investigation (Phase IIIb) Sylvania Corning FUSRAP Site, Hicksville, Nassau County, New York (CDM 2009). Two hundred and eighty samples (plus field quality control samples) were also collected for screening level purposes to guide ongoing field activities. These sample results were not validated.

1.1 Usability Summary

For this DUAR, five data packages were reviewed for volatile organic compounds (VOCs) and metals and eight packages for radionuclide (RAD) analytes as required in the QAPP (CDM 2009). The VOCs and metal analyses were completed by H2M Labs, Inc., Melville, New York and the RAD analyses was completed by Eberline Services/Oak Ridge Laboratory, Oak Ridge, Tennessee.

Samples were collected and analyzed in accordance with the QAPP (CDM 2009). Some deviations were encountered during the field investigation. Deviations are discussed in the DSR (CDM 2010). These deviations did not have an adverse impact on the project objectives.

The majority of the data collected during this site investigation and validated for this DUAR are usable as reported with the data validation qualifiers added. Seventy-six VOCs results, four metal results, and 104 RAD results were rejected because of various associated quality control measures exceeded criteria. These rejected results are described in detail in this report. These results are not usable for project purposes. The data rejected during validation were generally related to laboratory reported undetected or "U" qualified data, or data detected below the project action limit and therefore minimally impact the data set.

Section 2
Quality Assurance Objectives

Quality assurance (QA) objectives for measurement data are expressed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity (PARCCS). The QA objectives provide a mechanism for ongoing quality control (QC) and evaluating and measuring data quality throughout the project.

A review of the collected data is necessary in order to identify if data measurement objectives established in the QAPP have been meet. In general the following data measurement objectives were considered:

- Specification of particular analytical method and reporting detection limit requirements
- Identification of the appropriate laboratory analytical QC requirements
- Verification if appropriate levels of other PARCCS criteria for the data have been met
- Delineation of specific sample-handling issues or other project-specific issues

The data validation review of the QA objectives verifies that the collected data are of sufficient quality to support their intended use.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 3
Summary of Field and Laboratory QA Activities

CDM completed sampling activities in accordance with the approved QAPP (CDM 2009). The RI included collection of 349 water samples which were analyzed for VOCs, metals, and RAD analytes. Two hundred and eighty samples were designated for screening purposes and not subject to be validated because these data were used to help guide daily field activities. A summary of all the samples collected for this RI and the analyses performed are presented in Table 1. Samples were collected and shipped to H2M Labs, Inc., Melville, New York for VOCs and metals analyses and to Eberline Services/Oak Ridge Laboratory, Oak Ridge, Tennessee for RAD analyses. The QAPP (CDM 2009) defined the procedures to be followed and the data quality requirements for the field program.

3.1 Deviations from Field Procedures

Because of conditions encountered in the field, some deviations were made from the QAPP (CDM 2010) during the fieldwork portion of the RI. The deviations are discussed in the DSR (CDM 2010).

These deviations from the QAPP were minimal and did not impact DQOs for the project.

3.2 Field Quality QA/QC

Field QC samples such as matrix spike/matrix spike duplicates (MS/MSDs), field duplicates, field rinsates and trip blanks were to be collected at the frequencies defined in the QAPP (CDM 2009) which are one per 20 samples (5 percent) for MS/MSDs; one per 10 samples (10 percent) for field duplicates; one per boring or one per decontamination event or day for field rinsates; and one per cooler for trip blanks. For the validated samples, four MS/MSDs, eight field duplicates, one field rinsate sample and six trip blanks were collected. MS/MSD samples were collected at a frequency of 5.8 percent, field duplicates were collected at a frequency of 11.5 percent and trip blanks were collected with each cooler meeting the criteria defined in the QAPP (CDM 2009). One field rinsate sample was collected on the day non-dedicated sampling equipment was used. All other sampling was conducted with dedicated sampling equipment. The number of MS/MSDs, field duplicates, field rinsates and trip blank samples collected satisfies the total requirements in the QAPP (CDM 2009). Temperature blanks were included with each shipment of samples.

Field QA/QC objectives were accomplished through the use of appropriate sampling techniques and collection of field duplicates and field rinsates. Analytical QA/QC was assessed by laboratory QC checks, method blanks, sample custody tracking, sample preservation, adherence to holding times, laboratory control samples (LCSs), MSs, calibration recoveries, serial dilutions, laboratory duplicates, surrogate

recoveries, internal standards, tuning criteria, tracer criteria, carrier criteria, laboratory replicates and standards controls.

3.3 Laboratory Methods

The samples were analyzed using the following methods:

- SW-846 8260B – VOCs
- SW-846 3010A/6010B – metals
- SW-846 6020 - metals
- SW-846 7470A – mercury
- Method DOE-A-01-R Modified – isotopic uranium
- Method DOE-A-01-R Modified – isotopic thorium
- Method 9315 Modified – Radium-226
- Method 9320 Modified – Radium-228
- Method 9310 Modified – Gross Alpha/Beta
- Method 901.1 Modified – Gamma Spectroscopy/total uranium

All the methods used for this remedial investigation sampling event met project objectives.

Section 4
Data Validation Procedures

Data were validated and reviewed by qualified CDM data validators not associated with the sampling activities of this project. The data validation was performed in accordance with the following guidelines:

VOCs

- USEPA Hazardous Waste Support Branch Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8260 B – October 2006 – SOP # HW-24
- DoD Quality Systems Manual – Version 3 Final – Appendix D – June 2003
- Project-Specific Quality Assurance Project Plan for the Remedial Investigation (Phase IIIb) Sylvania Corning FUSRAP Site Hicksville, Nassau County, New York, August 2009

Metals

- Validation of Metals (Standard Operating Procedure [SOP] Revision 13) September 2006 – SOP #HW-2
- DoD Quality Systems Manual – Version 3 Final – Table B-6 and D18 – June 2003
- Project-Specific Quality Assurance Project Plan for the Remedial Investigation (Phase IIIb) Sylvania Corning FUSRAP Site Hicksville, Nassau County, New York, August 2009

RAD

- USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy, Revision 01, June 2004
- DoD Quality Systems Manual – Version 3 Final – Appendix D – June 2003
- Project-Specific Quality Assurance Project Plan for the Remedial Investigation (Phase IIIb) Sylvania Corning FUSRAP Site Hicksville, Nassau County, New York, August 2009

Thirteen data packages were validated, five for VOCs and metals and eight for RAD as discussed in Section 3.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 5
Data Quality Indicators

This section summarizes the validation performed and the overall quality of the data based on the PARCCS parameters. Individual sample delivery group (SDG) validation reports with specific sample detail are provided in Appendix A.

Achievement of the DQOs was determined by the use of data quality indicators (DQIs). DQI criteria was established in the QAPP (CDM 2009). These DQIs for measurement data, formerly called QA objectives, are expressed in terms of PARCCS. The DQIs provide a mechanism for ongoing control to evaluate and measure data quality throughout the project. These criteria are defined in the sections below.

5.1 Precision

Precision is a quantitative term that estimates the reproducibility of a set of replicate measurements under a given set of conditions. It is defined as a measurement of mutual agreement between measurements of the same property and is expressed in terms of relative percent difference (RPD) between duplicate determinations.

RPD is calculated as follows:

$$\text{RPD} = \text{absolute value } [(C1-C2)/\{(C1+C2)/2)\}] \times 100\%$$

Where:

C1 = concentration of primary sample
C2 = concentration of duplicate sample

The analytical precision for the reported data was determined by review of applicable laboratory duplicate results. Field and analytical precision was determined from the review of the field duplicate results. The sample results were compared by calculating their RPDs. The field duplicate samples were collected in the same manner as the original samples but were collected in separate, individual containers; given separate sample identifiers; and treated as individual samples by the laboratory.

Laboratory and field RPD results for the validated data are presented below:

VOAs

- Applicable MS/MSD samples were analyzed and all RPDs were within criteria.
- Laboratory duplicates were not analyzed for volatiles.
- The field duplicate RPD results for water samples were within acceptable criteria for the validated data (a control limit of 40 percent).

Metals

- The RPD recoveries between total and dissolved results were within criteria except for cobalt in SDG CDMF016. Both the total and dissolved results for cobalt in sample MW-28D were rejected "R."

- The laboratory duplicate RPD results were within criteria (20 percent for aqueous samples or within applicable laboratory defined limits) with the following exceptions listed below:
  - Manganese for seven samples in SDG CDMF013
  - Aluminum for one sample in SDG CDMF016
  - Manganese for 18 samples in SDG CDMF017
  - Manganese for 16 samples in SDG CDMF018

Following data validation procedures, associated sample results were qualified as estimated "J/UJ" and should be used with a degree of caution.

- The field duplicate RPD results for the water samples were within acceptable criteria except for the analytes identified in Table 2. The following sample results were qualified as estimated "J/UJ" due to field duplicate RPD results:
  - Iron in the field duplicate pair MW-49S/MW-902 in SDG CDMF016
  - Manganese in field duplicate pair MW-44S/MW-904 in SDG CDMF017

For metal RPD validation, a control limit of 40 percent RPD is used when both sample results are greater than 5 times the reporting limit (RL). If one or both of the sample results are less than the 5 times the RL a control limit of the RL absolute value is used for comparison.

The RPD for manganese is 73 percent and the iron field duplicate results failed the RL criteria. Neither of these compounds are indicated as compounds of concern for this site.

The project action limit is 300 µg/L for each of these compounds so although the iron results exceed criteria both results are less than the action limit. Similarly although the RPD for manganese exceeded criteria the reported concentrations for both samples indicated that the concentration for manganese is greater than the action limit.

RAD

- The replicate RPD results were within criteria except for gross beta in SDG 10-03176 and Radium-228 in SDG 10-04009. Associated sample results were estimated as "J." Thorium-230 replicate RPD (169.1 percent) was outside of criteria in SDG 10-03166 and Radium-228 RPD (193.59 percent) was outside of criteria in SDG 10-04046. Fifteen associated sample results in SDG 10-03166 and six associated sample results in SDG 10-04046 were rejected as other QC criteria was also outside of criteria.

- The field duplicate RPD results were within criteria for the RAD analyses except for the following:
  - Potassium-40, Radium-226, Radium-228 and Uranium-235 in field duplicate samples MW-23S/MW-901
  - Gross Alpha, Gross Beta, Radium-228 and Uranium-234 in field duplicate samples MW-49S/MW902
  - Gross Alpha in field duplicate samples MW-30I/MW-905
  - Bismuth-214, Lead-214, Thorium-230 and Uranium-234 in field duplicate samples MW-34S/MW906
  - Bismuth-214 and Lead-214 in field duplicate samples MW-29S/MS-900
  - Bismuth-214 and Uranium-235 in field duplicate samples MW-44/MW-904
  - Gross Beta, Potassium-40 and Radium-226 in field duplicate samples MW-24D/MW-903

These results were estimated "J" for the field duplicate pair samples only.

Most of the RPDs that were outside of criteria occurred when one sample result was nondetect and the other was detect. Other RPD exceedances were minimal and all sample results were below their associated project action limits (QAPP Worksheet #15).

Non-Validated Screening Level Field Duplicate Results

The following sections identify the results of the non-validated screening level field duplicate results.

VOCs

- The field duplicate RPD results for water samples were within acceptable criteria for the non-validated data (a control limit of 40 percent or RL criteria for low values) with the following exceptions listed below:
  - 2-Butanone in field duplicate samples MW-40S-VP03/ MW-40S-VP03-DUP – 66.7 percent RPD
  - Trichloroethene in field duplicate samples MW-50-VP09/MW_50-VP09-DUP – 66.7 percent RPD
  - Tetrachloroethene in field duplicate samples MW-53-VP07/MW53-VP07-DUP – 133.3 percent RPD
  - 1,1-Dichloroethane and acetone in field duplicate samples MW-54-VP07/MW-54-VP07-DUP – 54.5 percent RPD
  - Acetone in field duplicate samples RI-P-45-VP13/RI-P-45-VP13-DUP – 66.7 percent RPD

- Acetone in field duplicate samples RI-P-45-VP27/RI-PVP45-VP27-DUP – 66.7 percent RPD
- Tetrachloroethene in field duplicate samples RI-P-47-VP05/RI-P-VP47-VP05-DUP – 66.7 percent RPD
- Tetrachloroethene in field duplicate samples RI-P-48-VP11/RI-P-45-VP17-DUP – 139 percent RPD

No qualifiers were applied based on the RPD data listed above as this data has not been validated. This comparison was done to evaluate precision of the screening dataset. It should be noted that the RPD results listed above for 1,1-dichloroethane and tetrachloroethene are associated with results detected at or near the project action limit of 5 µg/L.

Metals

The field duplicate RPD results for the non-validated water samples were within acceptable criteria (a control limit of 40 percent RPD) except for the analytes identified in Table 3. The RL criteria was not evaluated for these screening samples as the data was not validated and a representative evaluation cannot be performed.

Three field duplicate pairs, MW-14DD-VP28/MW-14DD-VP28-DUP, MW-15DD-VP28/MW-15DD-VP28-DUP and RI-P-48-VP11/RI-I-45-VP17-DUP had numerous RPDs outside of criteria. The other field duplicates had one to approximately three RPDs outside of criteria. In almost all cases where RPDs exceeded criteria associated results were below the site action levels. To be conservative though, extra caution should be taken in making decisions in the areas where the above mentioned field duplicate pairs were collected due to the high degree of uncertainty regarding precision of field criteria.

RAD

- The field duplicate RPD results were within criteria for the non-validated RAD analyses except for the following:
  - Total Uranium in field duplicate samples MW-22I-VP05/MW-22I-VP05-DUP
  - Total Uranium in field duplicate samples MW-28I-VP04/MW-28I-VP04-DUP
  - Radium-226 and Thorium-230 in field duplicate samples MW-52-VP02/MW-52-VP02-DUP
  - Total Uranium in field duplicate samples MW-56-VP17/MW-56-VP17-DUP
  - Gross Alpha, Uranium-234, and Thorium-230 in field duplicate samples RI-P-47-VP05/RI-P-47-VP05-DUP

Most RPDs that exceeded criteria had low sample concentrations hence a higher RPD number is calculated. Overall the RAD screening level field duplicate RPD results exhibited good field precision.

Field duplicate results for the validated data are presented in the individual data validation reports in Appendix A and Table 2. Field duplicate results for the non-validated screening data are presented in Table 3. For the validated metals and RAD data, RPDs were calculated for all results including those that were nondetect in order to further evaluate precision of the field duplicates.

RPD objectives are analyte dependent. Duplicate results for concentrations near the detection limits (within 5 times the quantitation limit) are reviewed based on their absolute differences as compared to their respective quantitation limit values as described above when field duplicate RPDs exceed the QC limit. There is no discernable pattern or reason for the exceedences. No field sampling issues were identified from the RPD results that were outside of criteria for both the validated and non-validated data and the exceedances are reasonable for this type of sampling activity.

5.2 Accuracy

Accuracy is the degree of agreement of a measurement with an accepted reference or true value and is a measure of the bias in a system. Accuracy of the data was assessed by comparing LCS recovery, MS recovery, calibration recovery, internal standard checks, and surrogate recoveries and by performing serial dilution checks during metals analyses. Accuracy is expressed as percent recovery, which was calculated by:

$$\textbf{Percent Recovery} = \frac{\textbf{(Total Analyte Found - Analyte Originally Present) x 100}}{\textbf{Analyte Added}}$$

Analytical accuracy for the entire data collection activity is difficult to measure because several sources of error exist. Errors can be introduced by any of the following:

- Sampling procedure
- Field contamination
- Sample preservation and handling
- Sample matrix
- Sample preparation
- Analytical techniques

Accuracy is maintained by adhering to the EPA method and approved field and analytical standard operating procedures. CDM's validators reviewed the laboratories' data for accuracy by examining the reported calibrations, MS/MSD recoveries, LCS/LCS duplicate recoveries, serial dilutions, inductively coupled plasma (ICP) results (ICP interference check standards and ICP serial dilutions), tracer recoveries and carrier recoveries. Recoveries outside criteria are summarized below. The data validators qualified the data as required by the validation guidance.

For the data collected for the RI the following percent recoveries (%Rs) were outside of criteria:

VOAs

- MS %Rs were all within criteria.
- LCS %R's were all within criteria.
- The continuing calibration standards had several analytes outside of the percent difference (%D) criteria of 20 percent (30 percent for CCC compounds). The analytes that were outside of the calibration criteria were qualified as estimated "J/UJ" are listed below:
  - Acetone, dibromochloromethane and 1,2,3-trichlorobenzene in SDG CDMF013
  - Acetone, 4-methyl-2-pentanone, 2-hexanone and 1,2,3-trichlorobenzene in SDG CDMF014
  - 2-butanone, 4-methyl-2-pentanone, trichlorofluoromethane, 1,2,4-trichlorobenzene and 2-hexanone in SDG CDMF016
  - Trichlorofluoromethane, dichlorodifluoromethane, 1,2-dichloroethane, tetrachloroethene, 4-methyl-2-pentanone, 2-hexanone and 1,2,4-trichlorobenzene in SDG CDMF017
  - Dichlorodifluoromethane, acetone, methyl acetate, 1,2-dichloroethane, 4-methyl-2-pentanone and 2-hexanone in SDG CDMF018
- The initial and continuing calibration relative response factor (RRF) results were within criteria except for the following analytes:
  - 1,4-dioxane in SDG CDMF013
  - 1,4-dioxane in SDG CDMF014
  - 1,4-dioxane in SDG CDMF016
  - 1,4-dioxane in SDG CDMF017
  - 1,4-dioxane in SDG CDMF018

All 76 1,4-dioxane results were nondetect and were therefore qualified as rejected "R due to RRF criteria. Due to this rejection criteria, no 1,4-dioxane results are available for project decisions. 1,4-Dioxane is not a COC so the impact to the overall project objectives is limited.

Sample preservation, handling, and holding times are additional measures of accuracy of the data. All sample preservation and handling criteria were met and a review of the data confirmed that samples were analyzed within holding times, with the exception of two samples that were analyzed at a dilution for tetrachloroethene. The dilution analyses was performed at 13 days. The holding time criteria is 7 days for unpreserved samples hence the tetrachloroethene result from both dilution runs was qualified as estimated "J" due to holding time criteria. There is no negative

impact on the project since in both cases the dilution results for tetrachloroethene far exceeded the project action levels.

Metals

- All initial and continuing calibration %Rs were within criteria.
- Matrix spike recoveries were outside of criteria for the following analytes:
  - Aluminum, lead, and selenium in the dissolved analysis for SDG CDMF016
  - Chromium and lead in the total analysis for SDG CDMF017
  - Selenium in dissolved analysis for SDG CDMF018

All associated analytes were qualified as estimated "J/UJ." The non-detect sample results for aluminum and lead were rejected "R" due to percent recoveries above 150 in SDG CDMF016 for sample MW-28D.

- LCS recoveries were within criteria for all SDGs.
- All ICP Interference check standards were within criteria.
- ICP serial dilution %Ds were outside of criteria for the following anlaytes:
  - Cobalt (total/dissolved) and nickel (dissolved) in SDG CDMF014
  - Manganese (total), cobalt (dissolved), and nickel (dissolved) in SDG CDMF016
  - Manganese (total) in SDG CDMF017
  - Cobalt (total) and manganese (total) in SDG CDMF018

Associated sample results were qualified as estimated "J/UJ" with the exception of cobalt in SDG CDMF016 which was rejected "R."

- The RL check standard (CRI) recoveries were within criteria.

Sample holding times and preservation criteria were also reviewed. All samples were analyzed within the contract required holding times and all preservation criteria were met.

RAD

- MS %Rs were all within criteria except for the following:
  - Thorium-230 and Radium-226 in SDG 10-04004
  - Thorium-228, Thorium-230 and Radium-226 in SDG 10-03166
  - Radium-226 in SDG 10-04008
  - Thorium-230 and Radium-228 in SDG 10-04046

Associated sample results were qualified as estimated "J." The Thorium-230 results in SDG 10-03166 (15 results) and Radium-228 in SDG 10-04046 (6 results) were rejected as other QC criteria was also outside of criteria for these analytes.

- LCS %Rs were all within criteria except for Radium-228 in SDG 10-03166. Associated sample results were estimated "J."

- Tracer %R's were all within criteria except for Uranium-234, Uranium-235 and Uranium-238 for samples MW-31D, MW-51I and MW-42I in SDG 10-04009. Associated sample results were qualified as estimated "J."

Sample preservation, handling, and holding times are additional measures of accuracy of the data. All sample preservation and handling criteria were met and a review of the data confirmed that samples were analyzed within holding times.

5.2.1 Blank Contamination

Field equipment blanks and laboratory method blanks are analyzed to identify possible sources of contamination. Contamination of a sample can be introduced by field sample collection methods, sample handling, preparation, and/or analysis.

VOAs

- Tetrachloroethene was detected in the trip blanks above the reporting limit of 0.5 µg/L. The associated samples with tetrachloroethene results less than 5 times the concentration reported in the trip blank, have been qualified as nondetect "U."

- All method blank results were less than half of the reporting limit and less than the reporting limit for common laboratory contaminants.

- Acetone and o-xylene were detected in the field blank sample. All other results were nondetect. Associated samples were qualified as required.

Metals

- In all five of the SDGs, various analytes were detected between the method detection limits (MDLs) and the RLs in the laboratory method blanks:

  ICP AES

  - Potassium, copper, and iron in SDG CDMF013

  - Calcium, copper, iron, potassium, sodium, aluminum in the total analysis SDG and potassium in the dissolved analysis for SDG CDMF014

  - Potassium, sodium, calcium, and zinc in the total analysis and potassium in the dissolved analysis for SDG CDMF016

  - Mercury in the total analysis in SDG CDMF016

- Zinc, potassium, sodium, aluminum, and iron in the total analysis for SDG CDMF017

- Copper, potassium, sodium, aluminum, calcium, and magnesium in the total analysis and potassium, aluminum, copper, and magnesium in the dissolved analysis for SDG CDMF018

- Mercury for total analysis in SDG CDMF018

ICP MS

- Arsenic and lead in SDG CDMF013

- Antimony, lead, silver, arsenic, and nickel in the total analysis for SDG CDMF014 and lead, antimony, and arsenic in the dissolved analysis for SDG CDMF04

- Lead, and arsenic in the total analysis and arsenic and silver in the dissolved analysis for SDG CDMF016

- Lead and arsenic in the total analysis for SDG CDMF017

- Lead, antimony and silver in the total analysis and arsenic, lead, manganese, antimony, and silver in the dissolved analysis for CDMF018.

Following data validation criteria, associated sample results were qualified as nondetect "U" and the sample concentration was raised to the RL value. If the blank concentration was negative, the associated sample results were qualified as estimated biased low "J-/UJ."

- Aluminum, barium, chromium, cobalt, magnesium, manganese, vanadium and zinc were detected in the field rinsate sample collected with the metal samples. Associated sample results were qualified as nondetect if sample concentrations were less than the field blank concentration. Concentrations were also low. Field rinsate contamination was acceptable.

RAD

- The following analytes were detected in the laboratory method blanks:
  - Radium-226, Thorium-230 and Uranium-234 in SDG 10-03176
  - Gross Alpha and Radium-226 in SDG 10-04004
  - Protactinium-234M, Radium-228 and Thorium-230 in SDG 10-04045
  - Radium-226, Radium-228 and Uranium-234 in SDG 10-03166
  - Bismuth-212, Bismuth-214, Potassium-40, Radium-226 and Thorium-230 in SDG 10-04008
  - Radium-226, Radium-228 and Thorium-230 in SDG 10-04009

- Radium-226, Thorium-227, Thorium-228 and Thorium-230 in SDG 10-04046
- Radium-228, Thorium-227, Thorium-230 and Uranium-234 in SDG 10-04007

Following data validation criteria, associated sample results that had a normalized difference less than 1.96 were qualified as estimated "J."

- One validated field blank sample was collected with the samples in SDG 10-03166. Gross Beta and Radium-228 were detected. All associated sample results for Gross Beta were greater than the field blank result or nondetect so no qualifiers were required. Six sample results were estimated "J" for Radium-228 as the sample concentrations were less than the field blank concentration. The concentrations of these analytes were low. Field blank contamination was acceptable.

Non-Validated Screening Level Field Duplicate Results

VOCs

Acetone and tetrachloroethene were detected in one of the non-validated rinsate samples. Concentrations were low. All other rinsates sample results were nondetect. Field blank contamination was acceptable.

Metals

Various analytes were detected in the non-validated rinsate samples as shown on Table 5. In general concentrations were low.

RAD

Most of the RAD analytes were nondetect in the non-validated rinsate samples as shown on Table 5. Almost all detected results were low concentrations.

Field equipment blank results are presented in Table 4 for the validated samples and Table 5 for the non-validated samples. The data validators qualified the data on the basis of the laboratory and field blank contaminants as required by relevant data validation guidelines for the validated samples. The reported sample results are judged to be valid after validation. In general, all detected concentrations were low indicating field sample collection activities were adequately performed for the validated and non-validated data.

5.3 Representativeness, Comparability, and Sensitivity

Representativeness, comparability, and sensitivity are achieved by using EPA-approved sampling procedures and analytical methodologies. By following the QAPP (CDM 2009) procedures for the RI sampling this and future sampling events should yield results representative of environmental conditions at the time of sampling. Similarly, reasonable comparability of analytical results for this and future sampling events can be achieved if approved EPA analytical methods and standardized reporting units are employed.

5.3.1 Representativeness

Representativeness is a qualitative term that expresses the degree to which the sample data accurately and precisely represent the environmental conditions corresponding to the location and depth interval of sample collection. Requirements and procedures for sample collection are designed to maximize sample representativeness.

Representativeness also can be monitored by reviewing field documentation and/or by performing field audits. For this report, a detailed review was performed on the chain of custody forms, field data collection forms, and laboratory sample confirmation logs and data validation packages. Appropriate laboratory QA/QC requirements were described in the QAPP (CDM 2009) and laboratory statements of work (SOWs) to ensure that the laboratory analytical results were representative of true field conditions.

Field sampling accuracy was attained through strict adherence to the approved QAPP (CDM 2009) and by using EPA-approved analytical methods for sample analyses. Based on this, the data should represent as near as possible the actual field conditions at the time of sampling.

Representativeness, as defined above, has met the applicable requirements for the field work and laboratory analyses. Deviations to the planned sampling activity were minimal and did not compromise the ability of the data to represent conditions within the project area. Therefore, the data collected are suitable for a representative characterization of the project area.

5.3.2 Comparability

Comparability is a qualitative term that expresses the confidence with which a data set can be compared with another. Strict adherence to standard sample collection procedures, analytical detection limits, and analytical methods assures that data from like samples and sample conditions are comparable. This comparability is independent of laboratory personnel, data reviewers, or sampling personnel. Comparability criteria are met for the project if, based on data review, the sample collection and analytical procedures are determined to have been followed, or defined to show that variations did not affect the values reported.

To ensure comparability of data generated for the site, standard sample collection procedures and EPA-approved analytical methods were utilized by CDM. The sample analyses were performed by H2M Labs, Inc., Melville, New York and Eberline Services/Oak Ridge Laboratory, Oak Ridge, Tennessee using the same methodology as the Phase IIIa activities. Utilizing such procedures and methods enables the current data to be comparable with the previous data sets generated with similar methods.

5.3.3 Sensitivity

Sensitivity is related to the ability to compare analytical results with project-specific levels of interest, such as delineation levels or action levels. Analytical quantitation

limits for the various sample analytes should be below the level of interest to allow an effective comparison.

Detection Limits

Each analytical method used during the RI sampling was selected because it had a laboratory limit at or below the project objectives. For each analyte, the QAPP (CDM 2009) provided a Reference Limit and Evaluation Table (QAPP Worksheet #15) that the laboratory was to achieve to provide analytical results at or below regulatory comparison criteria which consists of Ambient Water Quality Standards and Guidance Value and Groundwater Effluent Limitations, New York State Department of Environmental Conservation (NYSDEC), June 1998 Edition for Class GA Standards and EPA Drinking Water Maximum Contaminant Limits (MCLs) EPA 816-F-02-013, July 2002.

The laboratory quantitation limit (QLs) are the minimum levels of quantitation acceptable under the QAPP (CDM 2009). The QL is generally equal to or greater than the method detection limit MDL. The QLs are set above MDLs to simplify comparisons between results from individual samples by minimizing influences from matrix effects (e.g., moisture content and high-level analytes) and to increase confidence in the reported values.

The MDL is described in the methods and is defined as the concentration of an analyte that produces a signal with a 99 percent probability that the concentration is above that of a blank. A blank is a sample that does not contain measurable concentrations of the analyte of concern. MDLs are usually at least less than one-half the QLs. Tested by statistical performance, calibration samples, and LCSs, MDLs represent the best fundamental measurement of instrument sensitivity and the basis for establishing quantitation limits.

Laboratory results are reported according to rules that provide established certainty of detection and quantitation limits. The result for an analyte is flagged with a "U" if that analyte was not detected or qualified with a "J" if blank QC results fall outside the appropriate tolerance limits or if the net blank results are not less than the associated uncertainty for RAD analyses (i.e., was not present at a concentration above the limit of measurement). If an analyte is present at a concentration between the MDL and the QL, the analytical result is flagged with a "J," indicating an estimated quantity. Qualifying the result as an estimated concentration reflects increased uncertainty in the reported value.

Quantitation limits are a compromise between analytical sensitivity and precision. Setting low QLs can lead to poorly defensible data because of false positive (Type I) and/or false negative (Type II) errors, whereas elevated QLs can hamper site characterization. Laboratory determinations of MDLs are performed on non-typical samples (e.g., distilled water) leading to idealized limits. Confidence in detection limits increases with instrument signal level above the MDL and higher limits mean better precision.

Although the QLs of some analyte groups are set high to avoid Type I and Type II errors, these limits provide a conservative picture of the nature and extent of contamination and the associated risk.

In general, for the data validated in this report, detection limits for the sample results were low enough to compare to the action levels stated in the QAPP (CDM 2009).

The VOA detection limits met QAPP (CDM 2009) criteria. Samples that had high concentrations were diluted according to laboratory criteria. Detection limits were raised where applicable.

The metal detection limits met QAPP (CDM 2009) criteria.

The RAD detection limits met QAPP (CDM 2009) criteria. Samples that had high concentrations were diluted according to laboratory criteria. Detection limits were raised where applicable.

RAD sample results were reviewed for quantitation and detection limits. This is done to ensure that the reported quantitation results are accurate and that the required detection limits have been met. All results were evaluated relative to the uncertainty associated with the analysis and reported by the laboratory with the sample results. All criteria followed is from the USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy (December 17, 2002), Revision 01, June 27, 2004. Sample results that were less than the uncertainty but greater than the MDA, and the uncertainty multiplied by 1.65 was greater than the MDA, the sample results were qualified as estimated "UJ." If the sample results were greater than the uncertainty but less than the MDA, and the uncertainty multiplied by 1.65 was greater than the MDA, the sample results were qualified as estimated "UJ." If the sample results were greater than the uncertainty but less than the MDA and the uncertainty multiplied by 1.65 was less than the MDA then the results were qualified as estimated "J." If the sample result was less than the uncertainty and also less than the MDA the samples were qualified as nondetect "U" unless the uncertainty multiplied by 1.65 was greater than the MDA in which case the results were qualified as nondetect and estimated "UJ." Negative sample results where the absolute values were greater than the uncertainty were rejected "R." All eight RAD SDGs had sample results that were either estimated as described above or rejected due to this criteria. A total of one hundred and four sample analyte results from all eight SDGs were rejected.

The data validation process also evaluates the data regarding compound quantitation limits. If sample results exceed calibration ranges, results are qualified appropriately as estimated J. Data validation also determines the most valid analyte result to use for samples that are re-analyzed or diluted. These validated results are entered into the project database and used for decision-making.

In general, detection limits met project goals and objectives as discussed above.

5.4 Data Completeness

Completeness of the field program is defined as the percentage of samples planned for collection as listed in the final work plan versus the actual number of samples collected during the field program (see equation A).

Completeness for acceptable data is defined as the percentage of acceptable data obtained judged to be valid versus the total quantity of data generated (see equation B). Acceptable data include both data that pass all the QC criteria (unqualified data) and data that may not pass all the QC criteria but had appropriate corrective actions taken (qualified but usable data).

A. $$\%\text{Completeness} = C \times \frac{100}{n}$$

Where:

C = actual number of samples collected
n = total number of samples planned

B. $$\%\text{Completeness} = V \times \frac{100}{n'}$$

Where:

V = number of measurements judged valid
n' = total number of measurements made

The completeness results are presented in Table 6.

The overall completeness goal for this project was 90 percent for all validated project data and 90 percent for site contaminants of interest.

A total of 349 environmental samples were collected to be analyzed by H2M and Eberline Services laboratories. This sample count included field duplicates, MS/MSDs, and field blanks. All samples outlined in the QAPP (CDM 2009) were collected as planned and based on field decisions more samples were also collected. The completeness for the number of samples planned to be collected versus the number of samples collected was 100 percent for VOCs, metals and RAD analyses.

The completeness goal for acceptable data achieved was 98.13 percent for VOCs, 99.52 percent for metals and 93.5 percent for RAD. The VOCs, metals and RAD completeness goals for acceptable data are over the 90 percent criteria for the number of measurements judged to be valid versus the total number of measurements made.

A total of 2.42 percent of the sample results were rejected. Seventy-six VOC sample results were rejected because of calibration criteria, four metal sample results were rejected because of MS criteria and 104 RAD sample results were rejected because of various validation criteria as discussed previously. The listed rejected results for VOCs and metals are not contaminants of concern (COCs) for the site so these rejected

results do not affect DQOs for the project. The listed rejected results for RAD thorium isotopes are COCs for the site. It should be noted that most of these thorium results were Th-234 results captured from the gamma spectroscopy screening analysis. Twenty-six out of 104, or 25 percent of the rejected results are thorium isotopes. There are a total of 405 thorium results for 81 RAD samples (includes filtered and unfiltered samples), which equates to 6.4 percent of the thorium isotope results being rejected. This meets the completeness goal of 90 percent and the impact to overall RAD results for project decisions is minimal.

The completeness goals for both the number of samples collected for the entire sampling event and the number of measurements judged to be valid for the limited data reviewed were met.

Deviations for sample collection are discussed in the DSR (CDM 2010). Sample deviations were driven by results based on field screening samples and did not impact DQOs for the project.

The data reported are suitable for their intended use as stated in the QAPP (CDM 2009) except for the rejected results. Overall, the DQIs identified in Worksheet #12 Measurement Performance Criteria of the QAPP (CDM 2009) met appropriate criteria. The achievement of the completeness goals for the data provides sufficient data for project decisions.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 6
Assessment of Data Usability and Reconciliation with Work Plan Goals

Ninety-eight percent of the data reported and validated in this DUAR are suitable for their intended use as stated in the QAPP (CDM 2009). One hundred and eighty-four sample results were rejected due to validation criteria. These data are not acceptable for use. Of the rejected sample results, six percent of the RAD thorium isotopes, which are COCs for the site, were rejected. The impact to the RAD results for project uses from the rejected sample results is minimal. The other rejected results were not COCs for the site. The detection limits reported do not exceed the expected limits as documented in the QAPP (CDM 2009) except for applicable dilutions. The achievement of the completeness goals for number of samples collected, and the number of sample results acceptable for use provides sufficient quality data to support project decisions. Field duplicate precision also met criteria a majority of the time. RPDs were outside criteria mostly when the sample results were close to the reporting limit and/or below the project required action limits. Decisions based on results close to the reporting limit should be made with a degree of caution.

Key:
U = Non-Detect
J = Value Estimated
NA = not analyzed and/or not applicable
abs. diff = a control limit of the reporting limit is applicable if the sample results are less than 5 times the RL
ug/L = microgram per Liter
RL- Reporting limit criteria. Both sample values are less than 5 times the RL and the absolute difference is less than the RL.
Outside of the 40% RPD criteria or RL criteria.
NC = not calculable

Key:
U = Non-Detect
J = Value Estimated
NA = not analyzed and/or not applicable
ug/L - micrograms per liter

Outside of the 40% RPD criteria or RL criteria.

Reporting limit and method detection limits were not provided with the table. As a result only the RPD values were checked.

Introduction

The Louis Berger Group, Inc. (LBG) and their subcontractor, Ecology and Environment (E & E), have been contracted by the United States Army Corps of Engineers (USACE), under Contract Numbers W912DQ-08-D-0017, Task Order No. 0019 and W912DQ-11-D-3009, Task Order No. 0012, to perform an Off-Site Groundwater Characterization and Feasibility Study (FS) at the Sylvania Corning Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Sylvania Site or the Site) located in Hicksville, Nassau County, New York.

The study objectives are to:

- Characterize the nature and extent of off-site groundwater contamination originating from the Sylvania Site.
- Determine if groundwater contaminants from the Sylvania Site are reaching the municipal water supply wells at the Hicksville Water District Plant 5 and Bowling Green facilities.
- Collect sufficient data to select remedial alternatives and prepare a FS for remediation of the Site.

This quality control summary report (QCSR) presents the results of the sampling and analytical program and provides an opportunity to review the completeness and quality of the data collected.

The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling investigation conducted at each site (see Section 1);
- Identify any deviations from the proposed sampling and analysis procedures (see Sections 1 and 2);
- Present the analytical results for the field samples collected (see Section 3);
- Report on any inspections or audits performed and any findings that that may impact the project data (see Section 4); and

- Discuss the results of the data quality evaluation associated with the sampling events (see Sections 2 and 5).

Evaluation of any contaminants detected will be provided in a separate Data Summary Report and the RI Report. The report also will contain maps of sample locations and summary tables of positive results.

Supporting information is included in appendices to the QCSR. The appendices are located on the attached DVD and include:

- Appendix A – Data Review Memoranda (DRM) and Data Usability Summary Report (DUSR) – The DRM or DUSR prepared for each sample delivery group (SDG) in PDF format.

- Appendix B – Analytical Data – All laboratory reports in PDF format which include case narratives and quality control (QC) sample results. The compact disc also includes a database of the final validated data in Electronic Data Management System (EDMS) format.

- Appendix C – Sample Collection Documentation – Daily activity summary reports (on CD), and field adjustment forms which document deviations from the planned activities. This appendix will also include documentation of field audits performed by Marcia Galloway of E & E and Christopher Watt of LBG.

1 Data Collection

Environmental samples were collected as part of the field characterization in accordance with the final Work Plan, Health and Safety Plan, and Quality Assurance Project Plan, Off-Site Groundwater Characterization and Feasibility Study for the Sylvania Corning FUSRAP Site (LBG May 2011). Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; containerization of investigation-derived waste (IDW); and site surveying were performed in accordance with the WP, QAPP, and documents referenced therein. All field QC activities were carried out in accordance with the final Quality Control Plan (QCP) (LBG 2011). Field data collection activities for each phase are summarized below. Audits were performed for each phase as described in Section 4.

Quality assurance/quality control (QA/QC) samples were collected on a site-wide basis according to the criteria established in the QAPP. The field QA/QC sample requirements are as follows:

- Field QC duplicates collected at a frequency of 10% of the number of field samples collected;
- Rinsates collected at a frequency of 10% of the number of field samples collected if non-dedicated equipment was used;
- Matrix spike/matrix spike duplicate (MS/MSDs) for laboratory QC collected at a frequency of 5% of the sample collected; and
- Trip blanks sent one per shipment for each cooler in which water samples for volatile analysis were shipped. Trip blanks were analyzed for all volatile methods designated for the samples.

Any minor variances in field methodologies that occurred during the characterization are noted on the daily activity summary reports or in the field logbook. Deviations from the WP were noted on field adjustment forms. Copies of these reports and forms are provided in Appendix C. The following sections summarize the deviations and fieldwork activities for each phase of fieldwork.

1.1 Off Site Groundwater Characterization Data Collection

This section of the QCSR summarizes the sampling results for Off Site Groundwater Characterization which included vertical profile groundwater screening sampling, monitoring well installation, well development, and the Summer 2012 monitoring well sampling event. The investigation was conducted between June 2011 and June 2012. Deviations to sampling procedures are presented in Appendix C and summarized below:

1.1.1 Drilling and Vertical Profile Sampling

The drilling and vertical profile sampling procedures were performed in accordance with the final Work Plan. Summaries of the exceptions to this are described below:

- The work plan stated that the last five samples collected from the planned end of each boring were to be submitted for quick turn analysis. In some cases, six samples were submitted for quick turnaround analysis (12 hour). This was done to ensure that an entire data set was available so that monitoring well screen placement decisions could be made as quickly as possible after the last sample had been collected.

- Drill water samples were collected quarterly rather than monthly. The water source (public water supply) did not change over the course of the investigation.

- Boreholes were cleared using post hole diggers and hand augers as opposed to air knife techniques described in the work plan. Since access to all locations was not available at the onset of the investigation, this method was most efficient.

- In cases where a groundwater profile sample could not be collected because of geologic restrictions or equipment failures, a second sample attempt was made as close to that depth as reasonably possible. This was not always within the 10 foot interval stated in the work plan.

1.1.2 Monitoring Well Development

The monitoring well development procedures were performed in accordance with the final Work Plan. Summaries of the exceptions to this are described below:

- The work plan states that a picture of the development water in a clear glass jar should be taken after the completion of development from each monitoring well. This step was inadvertently overlooked. However, turbidity readings were collected at each location and all had turbidities less than 50 NTUs and were clear at the completion of development. No staining was noted from any of the newly installed monitoring wells.

- The work plan states that a minimum of three times the drill water lost to the formation during drilling in the interval 15-feet above and below the center point of the chosen screen interval. The minimum volume of water removed during development was three times the volume of water lost in a 20-foot interval centered on the well screen depth. This maintained consistency with previous well development practices completed at the site.

1.1.3 Monitoring Well Installation

The monitoring well procedures were performed in accordance with the final Work Plan. Summaries of the exceptions to this are described below:

- The work plan states that if a boring was drilled more than three feet past the well screen depth, the boring should be backfilled with clean sand. In order to protect against a potential hydraulic connection with higher conductivity sands placed below the well screen than the surrounding formation, a two foot fine sand seal (Moorie #00 or equivalent) was used at the top of the backfilled material.

1.1.4 Groundwater Sampling

The groundwater sampling procedures were performed in accordance with the final Work Plan. Summaries of the exceptions to this are described below:

- The Summer 2012 sampling event described in the work plan was to sample only the 29 newly installed monitoring wells. The USACE team decided to sample the entire area wide monitoring wells for both Summer 2012 and Fall 2012 sampling events to provide a more comprehensive and comparative data set.

- Multiport monitoring well PW-5 was scheduled for sampling. However, water levels within the sample ports were nearly dry and depths to water were not indicative of aquifer conditions. The USACE team decided this well was not appropriate to sample as it does not appear to be operating properly.

- General Instruments (GI) monitoring well W-18-150 was not planned for sampling as it had been known to have an obstruction in the well that did not allow GTEOSI or GI sample the wells. The USACE team was able to install a well wizard pump with drop tubing to collect a sample from the well screen with low flow techniques.

- Monitoring well W-10-120 had an obstruction in the well and no sampling equipment could be installed to reach the well screen to allow for low flow sampling. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- The EPA Region 2 low flow sampling techniques do not require any minimum purge volume. Given the depth of the monitoring wells and amount of sample tubing required to reach the monitoring well screen depth (up to 570 feet BGS), the volumes of "stagnant" water contained within sampling devices can be several gallons. Given the purge rates of low flow sampling (less than 500 mls/min) it is conceivable that sample parameters could show stabilization and the well could be sampled prior to evacuating all "stagnant" water contained within the pumping device. This could provide a sample that is not representative of aquifer conditions. After review of USACE KC low flow techniques, the USACE team decided to require that a minimum of two volumes of water contained within the pumping device be removed prior to determining stabilization of parameters for sampling to ensure representative samples are collected.

- The multiport Anchor Chemical wells have seven small ports in a ~two inch well. When a pump is installed to purge the well there is not room to install a water level meter to monitor the water level conditions during purging as required if using low flow sampling techniques. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- Wells installed for investigation of the General Instruments site are aging and some of them are deteriorating. USACE had planned on sampling 36 of their wells as that is the number of wells that GTEOSI was able to collect samples from 2010 sampling event. Four active wells, W-15-168, W-17-130, W-18-150, and W-34-385, could not be sampled by GTEOSI because of obstructions in the well or the well was not found (W-15-168). USACE was able to install a pump in W-18-150 and W-17-130 and collect a sample possibly because smaller diameter pumps/equipment was used. The W-17-130 sample was inadvertently not analyzed. The field crew had the laboratory put the sample on hold while it was determined if it should be analyzed since at first it had not been planned. It was determined that it was best to have this sample analyzed. However, the laboratory never re-activated this sample and it was not analyzed. The total number of GI wells sampled was 37.

1.1.5 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP. There were no deviations from the WP with regards to sample handling or custody except for the following:

- The work plan stated that groundwater profile samples should be packaged and shipped for same day delivery. Although the majority of groundwater profile samples were delivered to the laboratory on the same day as collection, generally, samples collected after a 4 p.m. courier pick up were held on ice for delivery the following day. For aliquots requiring total uranium analysis, this

was not possible as the laboratory contracted for the analysis is located in Charleston, SC. As a result of the long hold times allowable with this analysis, aliquots were collected and stored until the boring was complete before being shipped to the laboratory.

- The work plan states that stainless steel containers were to be used to temporarily store aliquots for radiological analysis prior to field filtering groundwater profile samples. Stainless steel containers are not a requirement of the total uranium analytical SOP (ASTM D5174: KPA) as had been the requirement of previously used radiological analytical procedures at this site. High density polyethylene containers were used prior to filtering.

- The work plan states that all samples were to be stored on ice at temperatures between 2 and 4 degrees Celsius. The total uranium analysis SOP does not require icing of samples and therefore were not placed or stored on ice.

- In table 3.2-2 of the work plan, the analytical method EPA 200.8 is referred to as the selected method for total uranium analysis. It was decided by the USACE team to use ASTM D5174 (KPA) after the submission of the Final Work Plan.

- The QAPP states that all samples were to be collected into pre-preserved containers or preserved immediately after collection. During previous field investigations at this site, it was found that the turbid samples collected during groundwater profiling only reacted with acids used to preserve the samples causing the sample to bubble. This is problematic during VOC collection as it is difficult to collect a zero headspace sample during a reaction. For samples collected for nickel analysis, filtration of the sample to reduce turbidity was performed at the laboratory. The samples were preserved after filtration. Samples collected for total uranium analysis were collected into unpreserved containers and field filtered into pre-preserved containers at the end of each day.

1.1.6 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in LBG's QAPP. There were no deviations from the QAPP with regard to equipment calibration and maintenance.

1.1.7 Equipment Calibration and Maintenance

Samples were shipped to approved laboratories for analysis. Analytical methods in support of the Off Site Groundwater Characterization activities are referenced in the QAPP. American Analytical Laboratories (AAL) of Farmingdale, NY provided volatile and nickel analysis for the vertical profiling samples. GEL Laboratories of Charleston, South Carolina provided total uranium vertical profiling samples and monitoring well samples. Test America of Earth City, MO provided volatile and nickel analysis for all monitoring well samples. Table 1-1 lists all of

the analyses performed and the number of samples collected for methods for the investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-1 Summary of Analytical Methods and Samples Collected for Off Site Groundwater Characterization, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Lab Method Description	Number of Samples Analyzed
Groundwater – Vertical Profile	6010B	Method 6010B – Dissolved Metals Ni only	392
	8260B	Method 8260B – Volatile Organic Compounds by GC/MS in Water	396
	ASTM D 5174	Dissolved Total Uranium	60
Groundwater – Monitoring Wells	6010B	Method 6010B – Total Metals Ni only	198
	6010B	Method 6010B - Dissolved Metals Ni only	3
	8260B	Method 8260B – Volatile Organic Compounds by GC/MS in Water	208
	ASTM D 5174	Total Uranium	198
	ASTM D 5174	Dissolved Uranium	3

2 Data Analysis and Validation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, COC documents, statements in the laboratory case narratives, and field notebooks. Laboratory activities were conducted in accordance with the QAPP. The target compounds, practical quantitation limits (PQLs), and QC limits for the project were reviewed in accordance with the QAPP. Field duplicate and blank data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods. The final validated data was stored in an Environmental Quality Information Systems (EQuIS) format database.

LBG/E & E performed data review and validation of samples in accordance with the QAPP. The data review tasks completed for this project include:

- **Completeness.** LBG/E & E performed a completeness check on all EDDs and compared the data to the hard copy deliverable to verify the data were reported consistently.

- **Compliance.** LBG/E & E reviewed the laboratory reports and submitted EDDs, checked the hard copy reports and case narratives, and verified the EDD data submitted matched the hard copy data packages. E & E reviewed calibration information and compound identification results in the raw data package and entered the qualifiers.

- **Reporting.** E & E assigned data qualifiers and flagged all reportable data with review from LBG. Results of the data review are summarized in the DRM and DUSR in Appendix A. The DRM and DUSR contain a summary of the data that was qualified, and tables of the QC samples that did not meet applicable limits.

- **Data Management.** E & E developed a project-specific database with all validated data stored in EQuIS format. E & E developed reporting tables through the use of the EQuIS database. E & E generated summary tables of

final qualified data in Excel spreadsheets as shown in Section 3. Databases are provided in Appendix B.

QC samples were collected to assess the quality of the field sampling activities as described in Section 1. The evaluation of these samples was based on completeness of data, positive results of equipment and trip blank analysis, and relative percent differences (RPDs) of field duplicate results. ADR was used to evaluate field duplicates. Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DRM or DUSR. The field duplicate QC criteria are 40% for aqueous samples, and 70% for soil samples. The RPD ratings are listed as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Data were qualified "J" as estimated based on the data reviewers overall evaluation of field precision and accuracy. The qualification of data because of field duplicates is discussed at the end of each DRM or DUSR.

Field blanks were evaluated for each phase of sampling as described below. Field blanks were evaluated manually based on the associated samples and matrices and shipments.

The appropriate qualifiers were added to the data to indicate potential concerns with data usability. These qualifiers were transferred to the data presented on tables in Section 3. The following qualifiers were added:

J – This qualifier indicates an estimated value because the associated QC data indicated a potential laboratory or matrix problem or interference. In addition, J flags assigned by the laboratory to chemical data indicate the results are below the PQL but above the instrument detection limit (IDL) or method detection limit (MDL).

R – The positive results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified. Negative radiochemical results with absolute values greater than their 2-sigma uncertainty were rejected in accordance with the USACE Kansas City guidance document.

U – The result is considered non-detect. The laboratory assigned this flag to analytes not present at detectable concentrations (above the IDL or MDL). The data validator assigned this flag when an analyte was considered non-detect as a result of blank contamination. If the result is above the PQL, the PQL is considered elevated.

UJ – The non-detect value is considered estimated.

UR – The non-detect results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified.

The following sections summarize the data evaluation for each phase of fieldwork.

2.1 Vertical Profile Data Analysis and Review

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DRM was generated for each Monitoring Well (multiple SDGs within each) drilled and a copy of the DRM is included in Appendix A. The results were checked for completeness and are included in Appendix B. An index of the samples and associated SDG is provided in the beginning of the Appendix A for cross reference. Tables 1 and 2 of the DRM summarize the samples and methods included for each SDG.

2.1.1 Field Data Quality Evaluation

Table 2.1-1 provides a summary of the field QC samples and the associated field samples. Table 2.1-2 provides summaries of the sample collection frequency for the field QC samples by method.

Table 2.1-2 Field QC Samples by Method for Vertical Profile Sampling, Sylvania Corning FUSRAP Site

Analytical Method	Matrix	Number of Primary Samples	Number of Field Duplicates	Frequency	Number of Trip Blanks	Number of Field Blanks
SW6010C	Water	328	34	10%	NA	1
SW8260C	Water	329	34	10%	0	1
ASTM D5174	Water	50	6	10%	NA	0

Key:
NA = Not Applicable

2.1.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DRM. Field duplicate results are summarized on Table 7 of the DRM. Sampling or sample handling procedures are not considered of concern because of the minimal handling by field personnel.

Field duplicate samples overall showed good precision for the analytical methods being tested. Slight variations in sample concentrations were noted in several field duplicate and parent samples causing results to be qualified “J” as estimated. No data usability concerns are present due to the analysis of field duplicate samples.

2.1.1.2 Field Blanks

A field blank was collected because all samples were collected with disposable or dedicated equipment. No contamination of the field blank sample was detected. Trip blanks were not submitted to the laboratory due to the close proximity of the laboratory to the site, and the use of a courier service or drop offs at the laboratory were performed for sample delivery.

2.1.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DRM in Appendix A and summarized in a separate section for each analytical method described below.

2.1.2.1 Vertical Profile Groundwater Samples – Chemical Analysis

Method 8260C

Methylene Chloride was detected in all of the method blanks associated with this data. The sample results were qualified for method blank contamination as noted on the DRMs. Associated sample results were qualified "U" at the reporting limit if five times below the blank value.

LCS samples analyzed were within laboratory defined QC guidelines.

Matrix spike samples and duplicates were analyzed for the groundwater analysis by Method SW8260C. Several analytes were recovered low in MS sample for MW-204-VP04, results are qualified "J" as estimated as noted in the DRM. Several other MS/MSD pairs had RPDs that were outside of laboratory criteria, however those results were not qualified since no positive detections of those compounds were found in the parent samples associated with the pairs.

Method 6010C

No contamination of the method blanks associated with this data were found.

LCS samples were within laboratory defined QC guidelines with the exception of LCSW051812AD, all associated results with this sample are qualified "J" as estimated.

Matrix spike and duplicate pairs were within laboratory defined QC guidelines for this analysis.

2.1.2.2 Vertical Profile Groundwater Samples – Radiological Analysis

Method ASTM D5174

Uranium was detected in the method blank, QC1202561167. One sample MW-204-VP925 was qualified "U" based on this detection.

No other quality control deviations were encountered during the analysis of these samples.

2.2 Monitoring Well Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference.

Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG.

Sample Delivery Groups for Monitoring Well (Summer 2012) Sampling	Laboratory for Summer 2012
F2F060449	TestAmerica St. Louis

Table 2.2-2 Field QC Samples by Method for Monitoring Well Sampling (Summer 2012), Sylvania Corning FUSRAP Site

Analytical Method	Matrix	Number of Primary Samples	Number of Field Duplicates	Frequency	Number of Trip Blanks	Number of Field Blanks
6010B	Groundwater	175	18	10%	NA	5
8260B SIM	Groundwater	175	18	10%	10	5
ASTM D 5174	Groundwater	175	18	10%	NA	5

Key:
NA = Not applicable.

2.2.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 6 of the DUSR. Overall, field duplicate precision was good. RPD criteria were exceeded for seven field duplicate samples. Results of 1,1-dichloroethane and trichloroethylene in MW-08-R1; tetrachloroethylene in MW-15S-R1; cis-1,2-dichloroethylene in W-12-120-R1; uranium and tetrachloroethylene in MW-204-320-R1; and uranium in PW-7-2-R1, MW-55S-R1, MW-214-570-R, and W-11-70-R1were qualified as estimated.

2.2.1.2 Rinsate Blanks

Rinsate samples were collected at a rate of one every 35 groundwater samples. The bulk of the groundwater sampling equipment was dedicated pumps and tubing. Low levels of 2-butanone, acetone, methylene chloride, and toluene were detected in all five rinsate blanks. In addition, 1,2,3-trichlorobenzene was detected in RB-03-R1. These compounds were also detected in many of the trip blank samples. Refer to Table 3.2-2 for complete analytical results of the trip blank and rinsate samples.

Acetone, methylene chloride, 2-butanone, and toluene were consistently detected in the method blank samples. Acetone and methylene chloride are common laboratory reagents and the presence of acetone and methylene chloride in the rinsate blanks may be attributed to laboratory contamination and not field decontamination procedures. The deionized water used for decontamination or possibly the containers used to ship the water are additional likely sources of acetone in the rinsates, not the field decontamination procedures. Acetone was not used in the field as a decontamination agent.

2.2.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Tables 3 through 6 in the DUSR provide a list of sample results qualified and the reason for data qualification.

2.2.2.1 Groundwater Samples – Chemical Analysis

Method 8260B SIM

Toluene, methylene chloride, acetone, 2-butanone, and 1,2,4-trichlorobenzene were detected in method blanks at concentrations below the reporting limits. Associated sample results were qualified “U” at the reporting limit.

Internal standard area responses were outside of QC limits for several samples. 1,4-dioxane-d8 for sample MW211-455-R1, 1,4-dichlorobenzene-d4 for samples MW-52D-R1 and MW-31I-R1 were outside of the lower QC limit and 1,4-dichlorobenzene-d4 for sample MW-202-495-R1 is outside of the upper QC limit. The target analytes associated with these internal standards have been qualified as estimated ("J") qualifier.

Laboratory control sample recoveries were outside of QC limits for 1,1,2-trichloro-1,2,2-trifluoroethane and cyclohexane. Associated sample results were qualified as estimated ("J" qualifier).

Six samples were analyzed as MS/MSDs. 1,1,2-trichloro-1,2,2-trifluoroethane, cyclohexane, and acetone were consistently outside of QC limits for the MS/MSD samples. Associated parent sample results were qualified based on high or low recoveries.

Several sample results were qualified based on initial and/or continuing calibration criteria outliers. The relative standard deviation of chloroethane and 1,4-dioxane was outside of QC limits for the initial calibration and 2-butanone, 1,1,2-

trichloro-1,2,2-trifluoroethane, and 1,1,2-trichlorofluoroethane were outside of QC limits for the continuing calibration across several SDGs. Non-detect results were qualified "UJ" if the calibration criteria indicated a low bias. Associated positive results were qualified "J."

Method 6010B

No qualification of the nickel results was performed.

Method ASTM D 5174

The results of uranium were qualified "UJ" or "J" for several samples based on RPD values for the field duplicate.

3 Data Summaries

Tables summarizing the complete results for the site samples are provided in this section. Tables summarizing the positive results only will be provided in the associated data summary report that will be submitted under after completion of Fall 2012 groundwater sampling activities. Field duplicate results are presented along with the field samples. Table 7 in the DRM presented in Appendix A reports the RPDs for the field duplicates. The ADR outlier reports provided as an attachment to the DRM provide a summary of positive results for the QC samples outside QC criteria including positive results for method blanks and the associated data qualifiers.

Complete analytical results are provided in databases in Appendix B.

The following sections provide data tables for each phase of fieldwork.

3.1 Vertical Profile Data Summaries

Tables 3.1-1 and 3.1-2 include complete analytical results for Vertical Profile investigations conducted from July 2011 through May 2012.

3.2 Monitoring Well (Summer 2012) Data Summaries

Tables 3.2-1 through 3.2-3 include complete analytical results for Monitoring Well (Summer 2012) sampling conducting in June 2012.

4 System Audits

Audits were scheduled for the sampling phase for this project. Audits are summarized in Table 4-1 and included in Appendix C.

Table 4-1 Summary of System Audits

Audit Dates	Company	Scope of Audit and Summary of Findings
10/25/2011	E & E	Health and Safety Audit during the installation and soil sampling of MW203 and the sampling of MW212. At the time of the audit, the daily health and safety meeting had occurred but the acknowledgement form had not been signed by the field staff.
10/25/2011	E & E	Field audit of the Offsite Groundwater Characterization, rotosonic drilling and vertical profiling, was completed. Minor deviations from the WP were noted and corrected. Field team leader completed field adjustment forms to document deviations from the WP. Field logbooks and instrument calibration logs were reviewed for past field activities. Field team was instructed to document decontamination procedures in the logbook. The work plan and QAPP did not clearly distinguish procedures for sample handling for vertical profile versus regular well samples.
6/18/2012	LBG	Field audit of the Offsite Groundwater Characterization, groundwater sampling, was completed. Minor deviations from the WP were noted and corrected. Field team leader completed field adjustment forms to document deviations from the WP. Field logbooks and instrument calibration logs were reviewed for field activities.

5 Data Completeness and QA/QC Problems

This section summarizes the degree to which the analytical systems met or failed the data quality objectives (DQOs) listed in the QAPP. A discussion is provided for each phase of fieldwork.

5.1 Phase I Data Completeness

5.1.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.1-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 100% of the data are usable. The completeness goals for the project were met based on this percentage.

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	R	Total	Rejected
Water	SW6010C	90	125	106	65	0	386	0%
	SW8260C	1780	216	18390	947	0	21333	0%
	ASTM D5174	20	1	35	3	0	59	0%
Totals		**1890**	**342**	**18531**	**1015**	**0**	**21778**	**0%**

5.1.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Field duplicate sample precision for a minority of the analytes was not within QC criteria. Field duplicate sampling procedures does not appear to be a concern.

- The laboratory did not spike the full list of compounds into all MS/MSD pairs, however all Compounds of Concern were spiked and did not indicate any problems with the analysis.

- Calibration %D was exceeded for many analytes. Since calibration information was not provided by the laboratory, any compound qualified with a "C" by the laboratory is considered estimated and qualified "J".

5.2 Groundwater Data Completeness

5.2.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.2-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.2. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the data are useable. The completeness goals for the project were met based on this percentage.

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	Total	Rejected
Water	6010B	24	24	153		201	0.0%
	8260B	1,016	942	8,696	370	11,024	0.0%
	ASTM D5174	105	7	86	3	201	0.0%
Totals		**1,145**	**973**	**8,935**	**373**	**11,426**	**0.0%**

5.2.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures except for the concentration of 2-butanone, acetone, methylene chloride, toluene, and 1,2,3-trichlorobenzene were found in the some of the rinsate blanks. The recommended changes to procedures are as follows:

- Source water for equipment rinsates should be obtained from a verifiable source.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Some matrix effects were noted for 1,1,2-trichloro-1,2,2-trifluoroethane, cyclohexane, and acetone in the MS/MSD. There are no recommended changes for problems based on sample matrix.

- Acetone, methylene chloride, 2-butanone, and toluene were consistently detected in the method blank samples were consistently detected in the laboratory method blanks at concentrations above the MDL but below the reporting

limit. Toluene is not considered a common laboratory contaminant. Concentrations detected in the field samples were consistent with the method blank levels. None of the affected levels were above the PQL, and therefore should not impact data usability significantly.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time except for those listed on the table below.

Method	Sample ID	Sample Date	Matrix	Sample Date	Sample Type	Prep HT	Prep Date	AnalHT	Analysis Date	Sample Qual
NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the blanks except for methylene chloride, benzene, and chloroform as noted on Table 2. Results associated with these method blanks should be qualified “U” as not detected as noted in Table 2A.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged “J” as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

ClientSampID	TestNo
NA	NA

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 3 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for XXXXX as noted on Table 2A. Results associated with these method blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar

results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

None

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed on three sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

Table 2 - List of Positive Results for Blank Samples

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Drill water blanks were analyzed and showed Bromoform, Dibromochloromethane, and Nickel as noted on Table 2. Results associated with these blanks should be qualified "U" as not detected as noted on Table 2A and 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar

results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable).

The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed on 4 sets of samples collected for an overall frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method and field blanks except for methylene chloride, benzene, and chloroform as noted on Table 2. Results associated with these method blanks should be qualified “U” as not detected as noted on Tables 2A and 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate

compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged “J” as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed on two sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. Results associated with these rinsate blanks should be qualified "U" for not detected as noted on Table 2B. Results associated with drill water blanks should be qualified "U" for not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable

and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not

considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. No blank contamination was detected in the drill water except bromoform as noted on Table 2. Results associated with the rinsate and drill water blanks should be qualified "U" for not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis.

However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for

compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. Results associated with these rinsate blanks should be qualified "U" for not detected as noted on Table 2B. Results associated with the drill water blank should be qualified "U" for not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate

compounds added to the sample, only target analytes associated with that surrogate are flagged “J” as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. No blank contamination was detected in the drill water except bromomethane as noted on Table 2. Results associated with the rinsate and drill water blanks should be qualified "U" for not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable

and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

ClientSampID	TestNo
NA	NA

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall frequency of 10%. The RPD ratings are listed on Table 7 as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Field duplicate results with "Poor" are flagged "J" as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted in table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on table 2. Results associated with these rinsate blanks should be qualified "U" for not detected as noted in Table 2B. Results associated with the drill water blank should be qualified "U" for not detected as noted in Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable

and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

Work Order	Matrix	Sample ID	Lab ID	Sample Date	QC	MS/ MSD	ID Corrections

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. Results associated with these rinsate blanks should be qualified "U" for not detected as noted on Table 2B. Results associated with the drill water blank should be qualified "U" as not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable

and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

Table 2 - List of Positive Results for Blank Samples

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Results associated with these rinsate blanks should be qualified "U" as not detected as noted on Table 2B. Results associated with the drill water blank should be qualified "U" as not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable

and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “U” as not detected.

DATA REVIEW MEMORANDUM

DATE: October 11, 2012

TO: Dan Kennedy, Project Manager, E & E, Buffalo

FROM: Stephanie Chaffe, Chemist, E & E, Dallas

SUBJ: Data Review - Sylvania Vertical Profile Sampling

REFERENCE:

ProjectID	Lab Work Order
Sylvania Vertical Profile Sampling	1110151
	1110180
	1110183
	1110194
	1110212

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

Work Order	Matrix	Sample ID	Lab ID	Sample Date	QC	MS/ MSD	ID Corrections

1110212	GW	MW-203-VP40	1110212-01	10/28/2011			None

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified “U” as not detected as noted on Table 2A. No blank contamination was detected in the rinsate. No blank contamination was detected in the drill water blanks with the exception of nickel, bromoform, and dibromochloromethane. Results associated with this drill water should be qualified “U” as not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged “J” as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical

field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce

similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable).

The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A. No blank contamination was detected in the rinsate except chloroform and benzene as noted on Table 2. Results associated with these rinsate blanks should be qualified "U" for not detected as noted on Table 2B.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall project frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated. One field duplicate was analyzed for MW-201 and no analytes were detected in either sample.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

1110058	GW	RB-07	1110058-07B	10/6/11			None

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2A. Results associated with these method blanks should be qualified "U" as not detected. No blank contamination was detected in the rinsate except chloroform as noted on Table 2B. Results associated with these rinsate blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the

precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall frequency of 10%. The RPD ratings are listed on Table 7 as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Field duplicate results with "Poor" are flagged "J" as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

Work Order	Matrix	Sample ID	Lab ID	Sample Date	Lab QC	MS/ MSD	ID Corrections
1110223	AQ	FB01	1110223-01	10/31/2011			None

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method blanks except for methylene chloride as noted on Table 2. Results associated with these method blanks should be qualified "U" as not detected as noted on Table 2A.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the affects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar

results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgement was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates for this vertical profile sampling event were performed on 30 sets of samples collected for an overall frequency of 10%. The RPD ratings are listed on Table 7 as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Field duplicate results with "Poor" are flagged "J" as estimated.

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to GEL Laboratories, Charleston, SC for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method or field blanks except as noted on Tables 2A and 2B. Results associated with these method blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY (N/A)

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in

Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

ClientSampID	TestNo

V FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed for an overall frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

Method	Sample ID	Sample Date	Matrix	Sample Date	Sample Type	Prep HT	Prep Date	AnalHT	Analysis Date	Sample Qual

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method or field blanks except as noted on Table 2A. Results associated with these method blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY (N/A)

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in

Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

V FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data

qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed for an overall frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

DATA REVIEW MEMORANDUM

DATE: October 16, 2012

TO: Dan Kennedy, Project Manager, E & E, Buffalo

FROM: Joanna Christopher, Sr. Radiation Scientist, E & E, Buffalo

SUBJ: Data Review – Sylvania Vertical Profile Sampling

REFERENCE:

ProjectID	Lab Work Order
Sylvania Vertical Profile Sampling	286935

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included. All samples were sent to GEL Laboratories, Charleston, SC for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

Table 1 Sample Listing

Work Order	Matrix	Sample ID	Lab ID	Sample Date	Lab QC	MS/ MSD	ID Corrections
286935	GW	MW-201-VP17	286935001	9/22/11			
286935	GW	MW-201-VP19	286935002	9/23/11			
286935	GW	MW-201-VP21	286935003	9/23/11			

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan.

REVIEW RESULTS:

All sample procedures were followed and the sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time except for those listed on the table below.

Method	Sample ID	Sample Date	Matrix	Sample Date	Sample Type	Prep HT	Prep Date	AnalHT	Analysis Date	Sample Qual

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not

considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method or field blanks except as noted on Tables 2A and 2B. Results associated with these method blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY (N/A)

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the

precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

ClientSampID	TestNo

V FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed for an overall frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels,

then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. No blank contamination was detected in the method or field blanks except as noted on Tables 2A and 2B. Results associated with these method blanks should be qualified "U" as not detected.

3.0 SURROGATE SPIKE RECOVERY (N/A)

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. No additional data qualifiers were added if the samples were analyzed at dilutions. If the case of multiple surrogate compounds added to the sample, only target analytes associated with that surrogate are flagged "J" as estimated.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a

laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For inorganic analyses, all samples in the MS/MSD batch are qualified.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

All compound identification and quantitation criteria were achieved. The samples listed in the table below were analyzed at dilutions with elevated PQLs reported.

ClientSampID	TestNo

V FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were performed for an overall frequency of 10%. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than field duplicate QC criteria and as “Poor” if the RPD exceeded the field duplicate QC criteria. Field duplicate results with “Poor” are flagged “J” as estimated.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F300409
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes For Rad sample MW-818-GW-R1 the sample time is not listed on the COC but the laboratory sample tracking form states that the sample time is 1200. The Rad COC lists sample MW-202-495-R1 as the MS/MSD but the laboratory used a sample from a different SDG (S-1-32-R1).
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F300409
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Several compounds present in method and trip blanks at low levels.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Acetone was qualified as non-detect in all field samples due to method blank contamination. Methylene Chloride was qualified as non-detect in several samples due to trip blank contamination. There is no impact on data usability because the compounds found were common laboratory and field contaminants.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes - Recoveries of 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were high, associated sample MW-202-495-R1 is qualified "J" as estimated for these compounds.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – Recoveries of 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were high, no positive detections of these compounds found in environmental samples so no qualification of the data is required.

Data Usability Summary Report	**Project: Sylvania Phase IV**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – MW-202-380-R1 and PW-6-7-R1 were diluted/reanalyzed at dilutions due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. No field blanks were included with this SDG.
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
Acetone and Methylene Chloride were qualified as non-detect in several samples due to method and trip blank contamination. 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane qualified “J” as estimated due to MS/MSD recovery non-conformance. Several compounds qualified “J” as estimated due to Internal Standard (1,4-dichlorobenzene-d4) recovery in MW-202-495-R1.

Date Performed: 10/2/2012	Data Validation Review: J. Nelson

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F230409
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes- Acetone and Chloroethane were detected in the method blank at low levels. Acetone, 1,2,3-Trichlorobenzene, and 1,2,4-Trichlorobenzene were detected at low levels in the trip blank.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Acetone was qualified "U" as non-detect in three samples due to the detection of Acetone in the method blank. There is no impact on data usability because the compounds found were common laboratory and field contaminants.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were recovered high in batch QC MS/MSD. Cyclohexane qualified "J" as estimated in MW-207-250-R1 due to positive detection of compound. Cyclohexane was recovered high in MW-207-320-R1 MS/MSD. No qualification of the data necessary due to no positive detection of the compound in the parent sample. RPD for Methyl Acetate in MW-207-320-R1 MS/MSD was out of compliance, no qualification of the data necessary due to target analyte being non-detect in parent sample.

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F230409**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane was out of criteria for several LCS's. Cyclohexane was qualified "J" as estimated in MW-207-250-R1 due to this non-conformance.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – MW-207-170-R1, MW-29S-R1, and MW-33S-R1 were reanalyzed at dilution due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. No field blanks were included with this SDG.
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F230409
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 6	No The RPD for the field duplicate sample pair is 170; therefore the results for the field duplicate sample pair are qualified with J.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F230409
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane, 1,1,2-Trichlorofluoroethane had %D greater than 20%, associated compounds with batch 2185112 are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
The RPD for uranium for the field duplicate sample pair is outside criteria; therefore the field duplicate sample pair results are qualified with J. Several analytes qualified "U" as non-detect due to method blank contamination, also several analytes qualified "J" as estimated due to MS/MSD recovery, and LCS recovery.

SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F220444
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F220444
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Several compounds were detected in the method, field (rinsate), and trip blanks.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several analytes were flagged for trip and method blank contamination. Rinsate blank contamination did not qualify any results in this data set. There is no impact on data usability because the compounds found were common laboratory and field contaminants.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Batch QC used for MS/MSD results, several compounds out of compliance for selected samples. All samples in associated batches qualified for analytes shown on Table 4.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were out of criteria for multiple LCS samples. 1,1,2-Trichloro-1,2,2-Trifluoroethane was qualified "J" as estimated due to detection of this compound in sample W-36-448-R1.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F220444
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were diluted/reanalyzed at dilution due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Rinsate blank sample RB-05-R1 met criteria.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F220444
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	Yes.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No VOCs – IS #4 (1,4-Dichlorobenzene-d4) was recovered low for MW-52D-R1 and MW-31I-R1, associated compounds with this internal standard are qualified "J" as estimated due to this non-conformance.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No – 2-Butanone had %D greater than 20% in CCV 1177 associated sample results are qualified "J" as estimated. 2-Butanone had %D greater than 20% in CCV 1250, associated sample results are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F220444
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
MS/MSD, LCS, CCV, and Internal Standard Recoveries qualified several compounds across multiple samples, see Tables for individual samples and compounds qualified.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F200416
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple compounds were detected in method, trip, and rinsate blanks associated with samples in this SDG.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples had analytes qualified as non-detect due to method, and rinsate blank contamination. There is no impact on data usability because the compounds found were common laboratory and field contaminants, and not compounds of concern for this site.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Batch QC samples, and MS/MSD from this SDG were non-compliant with QC criteria, and qualified analytes in multiples samples as estimated.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – Multiple analytes were outside of QC criteria. Only 1,1,2-Trichloro-1,2,2-Trifluoroethane was qualified as estimated in a sample.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F200416
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Multiple samples had to be run at dilution/reanalyzed at a dilution due to high concentrations of target analytes. Only one result is reported from these analyses.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Rinsate blank sample RB-04-R1 met criteria.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F200416
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported except for sample S-1-325-R1, for which the reanalyzed results are reported. The RDL was not met for this sample due to matrix interferences (MDL =0.1153; RDL = 0.100).

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No – 2-Butanone had %D greater than 20% for batch 2179100, all results from this batch are qualified "J" as estimated for this compound.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F200416
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
RDL for total uranium analysis not met for one sample due to interferences – DL only slightly elevated. Precision for total uranium for one field duplicate sample pair outside criteria; field duplicate sample pair results qualified UJ/J. For VOC analysis, blank contamination, MS/MSD recovery and RPD non-conformance, LCS non-conformance, and Continuing Calibration Verification qualified multiple analytes across multiple samples. No data was rejected due to these non-conformances.

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F160407**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F160407
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple analytes were detected in the method, rinsate, and trip blanks.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes - Acetone, Methylene Chloride, and 1,2,4-Trichlorobenzene were qualified as non-detect in multiple samples due to blank contamination. There is no impact on data usability because the compounds found were common laboratory and field contaminants, and not contaminants of concern for this project.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – MW-205-470-R1 MS/MSD analysis had multiple outliers, no data was qualified as there were no positive detections in the parent sample.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – LCS F2F250000-058 had multiple analytes out of QC criteria. Positive detections of 1,1,2-Trichloro-1,2,2-Trifluoroethane associated with this LCS are qualified "J" as estimated.

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F160407**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Multiple samples for SW8260B analysis were diluted due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blank samples included in this SDG.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F160407
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported except for sample MW-23I-R1, for which the diluted reanalyzed results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	No – 1,4-Dioxane RSD is greater than 15%, all results in SDG are qualified "J" as estimated due to this non-conformance.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F160407
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
None for Uranium analysis. VOC analysis was affected by method, trip, and rinsate blank contamination, MS/MSD recovery, LCS recovery, and Initial Calibration analysis.

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes One sample bottle was received at GEL for uranium analysis without a sample ID or time; the laboratory determined it to be W17-130-R1 because it was the only sample ID on the COC that did not have an accompanying sample.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes The laboratory used samples W-27-240-R1 and W-36-390-R1 for the uranium MS/MSDs although the COC listed sample W-27-285-R1 as MS/MSD.
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple analytes were present in method, and rinsate blanks. TB-05-R1 was only run for SIM analysis (1,4-Dioxane), not the full SW8260B list.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Multiple samples had analytes qualified as non-detect due to method and rinsate blank contamination. There is no impact on data usability because the compounds found were common laboratory and field contaminants, and not a contaminant of concern for the site.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Cyclohexane was non-compliant in a Batch QC MS/MSD, positive detections of this compound in this SDG are qualified "J" as estimated.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F150421
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Multiple samples were run at dilution due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	No.

Compliance Review Total U Analysis - Approval by Data Validation Chemist Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Rinsate blank sample RB-03-R1 met criteria.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F150421
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	No – 1,4-Dioxane had RSD >15%, sample results for this SDG are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F150421
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
Precision for uranium for a field duplicate sample pair was outside criteria; results for field duplicate sample pair qualified with J. Multiple analytes were flagged as non-detect due to method and rinsate blank contamination. MS/MSD non-conformance qualified cyclohexane as estimated in one sample, and multiple analytes are flagged as estimated due to field duplicate RPDs.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F130434
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes Sample W-6-79-R1 for uranium analysis was mislabeled as W-6-76-R1 and was corrected by the laboratory.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes The laboratory used samples other than those listed on the COC for the uranium MS/MSDs.
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F130434**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple compounds present in method, trip, and rinsate blanks.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Multiple samples were flagged as non-detect due to method, trip, and rinsate blank contamination. There is no impact on data usability because the compounds found were common laboratory and field contaminants, and not compounds of concern for this project.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Batch QC MS/MSD, and MS/MSD for this SDG were non-compliant. Cyclohexane was recovered low in MS/MSD for PW-2-2-R1 and results were qualified "UJ" as estimated.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F130434
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were run at a dilution due to high concentrations of Tetrachloroethylene.
Do field duplicate results show good precision for all compounds? See Table 6	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Rinsate blank sample RB-02-R1 met criteria.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F130434
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	No – 1,4-Dioxane had RSD greater than 15%, all results for this SDG are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	Yes
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F130434
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
Precision for uranium for a field duplicate sample pair was outside criteria; results for field duplicate sample pair qualified with J. VOC analysis was affected by method blank, trip blank, rinsate blank contamination, as well as MS/MSD recovery, and Initial Calibration RSD.

Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Method	Analyte	Units	W-03-112-R1	MW-808-GW-R1	RPD	Rating	Sample Qualifier
ASTM D5174	Uranium	ug/L	ND	ND	N/A	Good	None
SW8260B	TETRACHLOROETHYLENE(PCE)	ug/L	24	24	0.0	Good	None
SW8260B	TRICHLOROETHYLENE (TCE)	ug/L	1.9	1.8	5.4	Good	None

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F090408**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes The laboratory used sample other than that listed on the COC for the uranium MS/MSD.
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F090408
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Several compounds were present in the method, trip, and rinsate blanks
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Acetone, Toluene, and Methylene Chloride were flagged as non-detect due to contamination in the method, trip and rinsate blanks.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane, and Cyclohexane were non-compliant in MS/MSD pairs. No results were qualified as there were no positive detections in the parent samples.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - 1,1,2-Trichloro-1,2,2-Trifluoroethane, and Cyclohexane were non-compliant in LCS F2F160000-013, no results were qualified due to this non-conformance.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F090408
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples MW-22S-R1 and MW-R110-440-R1 were diluted due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blank samples included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F090408
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No – 1,4-Dioxane is Qualified "J" in sample MW-211-455-R1 due to low IS recovery
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	No – Chloromethane had RSD greater than 15% samples are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No- Cyclohexane had %D greater than 20%, associated samples in batch 2168013 are qualified "J" as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F090408
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
Precision for uranium for a field duplicate sample pair was outside criteria; results for field duplicate sample pair qualified with UJ or J. VOC samples are qualified due to method, trip, and rinsate blank contamination, internal standard recovery, and continuing calibration %D. No results are rejected due to these non-conformances.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	**Project: Sylvania Phase IV**
Laboratory: TestAmerica	**LAB SDG ID: F2F080482**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes Sample TB-0-R1 was mistakenly added to the COC for the uranium samples and the lab was notified by email.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes The laboratory used sample other than that listed on the COC for the uranium MS/MSD.
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F080482
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Several compounds were detected in the method, trip, and rinsate blanks.
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified as non-detect due to method and rinsate blanks.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were non-compliant for MS/MSD recovery. MS/MSD RPD was also non-compliant for multiple analytes causing the analytes to be "J" flagged as estimated in the parent samples. Batch QC samples caused 1,1,2-Trichloro-1,2,2-Trifluoroethane positive results in this SDG to be qualified "J" as estimated as well.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – 1,1,2-Trichloro-1,2,2-Trifluoroethane and Cyclohexane were non-compliant. 1,1,2-Trichloro-1,2,2-Trifluoroethane was qualified "J" for positive results for samples associated with MT6AN1AC.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F080482
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Multiple samples were run at a dilution due to high concentration of target analytes, only one result was reported for each sample.
Do field duplicate results show good precision for all compounds? See Table 6	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Rinsate blank sample RB-01-R1 met criteria.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No Several samples were re-prepared and re-analyzed due to method blank contamination; re-prepared results are reported.
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	No The MS/MSD recoveries for sample MW-43S-R1 did not meet criteria but this was due to the sample concentration of uranium being greater than 5 time the spiked concentration; therefore no qualifiers were added.

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F080482
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported. Several samples were diluted and the diluted results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	No – Chloromethane had RSD greater than 15%, all samples in this SDG are qualified "J" as estimated for this analyte.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F080482
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
For VOC analysis, Method blank and Rinsate Blank contamination qualified analytes as non-detect in multiple samples, MS/MSD recovery and RPD qualified analytes as estimated in multiple samples. LCS recovery qualified an analyte as estimated in multiple samples. All samples in this SDG are qualified as estimated for Chloromethane due to Initial Calibration non-conformance.

SW8260B	CHLOROFORM	ug/L	8.5	8.3	2.4	Good	None

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	**LAB SDG ID: F2F060449**
Date Completed: 9/30/2012	**Data Validation Chemist: B. Kroon and J. Christopher**
Date Performed: 10/2/2012	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Tests and Number of Samples. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes GEL Laboratories will provide a revised data package for the total uranium analyses as chemical rather than radiochemical data because the KPA procedure is a chemical procedure using phosphorescence for quantitation instead of radiological counting.
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JZC/BK

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F060449
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple compounds present in associated Rinsate Blank
Were any analytes flagged for blank contamination? See Table 3A and Table 3B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	No
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Trichloroethene and cis-1,2-Dichloroethene were recovered low in MS/MSD pairs. Associated parent samples are qualified "J" as estimated for these compounds.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F060449
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Two samples were analyzed at a dilution due to high concentration of target analytes.
Do field duplicate results show good precision for all compounds? See Table 6	No – Multiple analytes had RPDs greater than project goals, associated duplicate and parent samples are qualified "J" as estimated for those compounds.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3A and 3B *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F060449
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 6	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported. One sample was diluted and the diluted result is reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Phase IV
Laboratory: TestAmerica	LAB SDG ID: F2F060449
Date Completed: 9/30/2012	Data Validation Chemist: B. Kroon and J. Christopher
Date Performed: 10/2/2012	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Indicate any concerns that involve rejected data or data that are may not allow comparison to criteria.
Minor Concerns
MS/MSD recovery and field duplicate precision qualified analytes as estimated “J”. No impact on data usability was observed.

Introduction

The Louis Berger Group, Inc. (LBG) and their subcontractor, Ecology and Environment, Inc. (E & E), have been contracted by the United States Army Corps of Engineers (USACE), under Contract Numbers W912DQ-08-D-0017, Task Order No. 0019 and W912DQ-11-D-3009, Task Order No. 0012, to perform an Off-Site Groundwater Characterization and Feasibility Study (FS) at the Sylvania Corning Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Sylvania Site or the Site) located in Hicksville, Nassau County, New York.

The study objectives are to:

- Characterize the nature and extent of off-site groundwater contamination originating from the Sylvania Site.
- Determine if groundwater contaminants from the Sylvania Site are reaching the municipal water supply wells at the Hicksville Water District Plant 5 and Bowling Green facilities.
- Collect sufficient data to select remedial alternatives and prepare a FS for remediation of the Site.

This quality control summary report (QCSR) presents the results of the sampling and analytical program and provides an opportunity to review the completeness and quality of the data collected.

The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling investigation conducted (see Section 1);
- Identify any deviations from the proposed sampling and analysis procedures (see Sections 1 and 2);
- Present the analytical results for the field samples collected (see Section 3);
- Report on any inspections or audits performed and any findings that that may impact the project data (see Section 4); and

- Discuss the results of the data quality evaluation associated with the sampling events (see Sections 2 and 5).

Evaluation of any contaminants detected will be provided in a separate Data Summary Report and the RI Report. The report also will contain maps of sample locations and summary tables of positive results.

Supporting information is included in appendices to the QCSR. The appendices are located on the attached DVD and include:

- Appendix A –Data Usability Summary Report (DUSR) – The DUSR prepared for each sample delivery group (SDG) in PDF format.

- Appendix B – Analytical Data – All laboratory reports in PDF format which include case narratives and quality control (QC) sample results. The compact disc also includes a database of the final validated data in Electronic Data Management System (EDMS) format.

- Appendix C – Sample Collection Documentation – Daily activity summary reports (on CD), and field adjustment forms which document deviations from the planned activities. This appendix also will include any audits performed.

1 Data Collection

Environmental samples were collected as part of the field characterization in accordance with the final Work Plan, Health and Safety Plan, and Quality Assurance Project Plan, Off-Site Groundwater Characterization and Feasibility Study for the Sylvania Corning FUSRAP Site (LBG May 2011). Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; and containerization of investigation-derived waste (IDW) were performed in accordance with the WP, QAPP, and documents referenced therein. All field QC activities were carried out in accordance with the final Quality Control Plan (QCP) (LBG 2011). The contents of this QCSR summarized the Fall 2012 area wide sampling event that included collection of 175 monitoring well samples.

Quality assurance/quality control (QA/QC) samples were collected on a site-wide basis according to the criteria established in the QAPP. The field QA/QC sample requirements are as follows:

- Field QC duplicates collected at a frequency of 10% of the number of field samples collected;
- Rinsates collected at a frequency of 10% of the number of field samples collected if non-dedicated equipment was used;
- Matrix spike/matrix spike duplicate (MS/MSDs) for laboratory QC collected at a frequency of 5% of the sample collected; and
- Trip blanks sent one per shipment for each cooler that included water samples for volatile analysis. Trip blanks were analyzed for all volatile methods designated for the samples.

Any minor variances in field methodologies that occurred during the characterization are noted on the daily activity summary reports or in the field logbook. Deviations from the WP were noted on field adjustment forms. Copies of these reports and forms are provided in Appendix C. The following sections summarize the deviations and fieldwork activities.

1.1 Off Site Groundwater Characterization Data Collection

This section of the QCSR summarizes the sampling results for the Off Site Groundwater Characterization – Fall 2012 monitoring well sampling event. This consisted of sampling of 91 USACE monitoring wells, 11 wells installed by GTEOSI, 34 wells installed as part of the General Instruments inactive hazardous waste site investigation, and 38 samples collected from 5 multiport wells installed as part of the Anchor Chem inactive hazardous waste site investigation. The sampling event was conducted between 25 October and 17 November 2012. Deviations to sampling procedures are presented in Appendix C. The groundwater sampling procedures were performed in accordance with the final Work Plan (LBG May 2011). Summaries of the exceptions to this are described below:

- Multiport monitoring well PW-5 was scheduled for sampling. However, water levels within the sample ports were nearly dry and depths to water were not indicative of aquifer conditions during the Summer 2012 sampling event. The USACE team decided this well was not appropriate to sample as it does not appear to be operating properly and the condition could not be verified.

- Monitoring well W-10-120 had an obstruction in the well and no sampling equipment could be installed to reach the well screen to allow for low flow sampling. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- The EPA Region 2 low flow sampling techniques do not require any minimum purge volume. Given the depth of the monitoring wells and amount of sample tubing required to reach the monitoring well screen depth (up to 570 feet BGS), the volumes of "stagnant" water contained within sampling devices can be several gallons. Given the purge rates of low flow sampling (less than 500 mls/min) it is conceivable that sample parameters could show stabilization and the well could be sampled prior to evacuating all "stagnant" water contained within the pumping device. This could provide a sample that is not representative of aquifer conditions. After review of USACE KC low flow techniques, the USACE team decided to require that a minimum of two volumes of water contained within the pumping device be removed prior to determining stabilization of parameters for sampling to ensure representative samples are collected.

- The multiport Anchor Chemical wells have seven small ports in a ~two inch well. When a pump is installed to purge the well there is not room to install a water level meter to monitor the water level conditions during purging as required if using low flow sampling techniques. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater

quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- Wells installed for investigation of the General Instruments site are aging and some of them are deteriorating. USACE had planned on sampling 36 of their wells as that is the number of wells that GTEOSI was able to collect samples from 2010 sampling event. Four active wells, W-15-168, W-17-130, W-18-150, and W-34-385, could not be sampled by GTEOSI because of obstructions in the well (W-34-385) or the well was not found (W-15-168). USACE was able to install a pump in W-18-150 and W-17-130 and collect a sample possibly because smaller diameter pumps/equipment was used. The total number of GI wells sampled was 38.

1.1.1 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP (LBG May 2011). There were no deviations from the WP with regards to sample handling or custody except for the following:

- The work plan states that all samples were to be stored on ice at temperatures between 2 and 4 degrees Celsius. The total uranium analysis SOP does not require icing of samples and therefore were not placed or stored on ice.

- In table 3.2-2 of the work plan, the analytical method EPA 200.8 is referred to as the selected method for total uranium analysis. It was decided by the USACE team to use ASTM D5174 (KPA) after the submission of the Final Work Plan.

1.1.2 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in LBG's QAPP. There were no deviations from the QAPP with regard to equipment calibration and maintenance.

1.1.3 Equipment Calibration and Maintenance

Samples were shipped to approved laboratories for analysis. Analytical methods in support of the Off Site Groundwater Characterization activities are referenced in the QAPP. GEL Laboratories of Charleston, South Carolina provided total uranium for all monitoring well samples. Test America of Earth City, MO, Edison, NJ, and Buffalo, NY provided analysis for volatile, nickel, and all monitored natural attenuation parameters (MNAs) except hydrogen and *dehalococcoides spp.* The hydrogen analysis was performed by Microseeps in Pittsburgh, PA and the *dehalococcoides spp.* was performed by Microbac in Maryville, Tennessee. r Table 1-1 lists all of the analyses performed and the number of samples collected for methods for the investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-1 Summary of Analytical Methods and Samples Collected for Off Site Groundwater Characterization, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Lab Method Description	Number of Samples Analyzed
Groundwater – Monitoring Wells	6010B	Method 6010B – Total Metals Ni only	177 samples, 18 dups, and 5 rinse blanks
	6010B	Method 6010B - Dissolved Metals Ni only	4 samples
	8260B	Method 8260B – Volatile Organic Compounds by GC/MS in Water	177 samples, 18 dups, 5 rinse blanks, and 7 trip blanks
	ASTM D 5174	Total Uranium	177 samples, 18 dups, and 5 rinse blanks
	ASTM D 5174	Dissolved Uranium	4 samples
Groundwater - Monitoring Wells - Natural Attenuation Parameters	3810M	Methane, Ethene, Ethan, and Propane using Static Headspace	11

	Local Method	Dehalococcoides by Molecular PCR	11
	AM20GAX	Hydrogen	11

2 Data Analysis and Validation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, COC documents, statements in the laboratory case narratives, and field notebooks. Laboratory activities were conducted in accordance with the QAPP. The target compounds, practical quantitation limits (PQLs), and QC limits for the project were reviewed in accordance with the QAPP. Field duplicate and blank data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods. The final validated data was stored in an Environmental Quality Information Systems (EQuIS) format database.

LBG/E & E performed data review and validation of samples in accordance with the QAPP. The data review tasks completed for this project include:

- **Completeness.** LBG/E & E performed a completeness check on all EDDs and compared the data to the hard copy deliverable to verify the data were reported consistently.

- **Compliance.** LBG/E & E reviewed the laboratory reports and submitted EDDs, checked the hard copy reports and case narratives, and verified the EDD data submitted matched the hard copy data packages. E & E reviewed calibration information and compound identification results in the raw data package and entered the qualifiers.

- **Reporting.** E & E assigned data qualifiers and flagged all reportable data with review from LBG. Results of the data review are summarized in the DUSR in Appendix A. The DUSR contain a summary of the data that was qualified, and tables of the QC samples that did not meet applicable limits.

- **Data Management.** E & E developed a project-specific database with all validated data stored in EQuIS format. E & E developed reporting tables through the use of the EQuIS database. E & E generated summary tables of final qualified data in Excel spreadsheets as shown in Section 3. Databases are provided in Appendix B.

QC samples were collected to assess the quality of the field sampling activities as described in Section 1. The evaluation of these samples was based on complete-

ness of data, positive results of equipment and trip blank analysis, and relative percent differences (RPDs) of field duplicate results. ADR was used to evaluate field duplicates. Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. The field duplicate QC criteria are 40% for aqueous samples, and 70% for soil samples. The RPD ratings are listed as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Data were qualified "J" as estimated based on the data reviewers overall evaluation of field precision and accuracy. The qualification of data because of field duplicates is discussed at the end of each DUSR.

Rinse blanks were evaluated for each phase of sampling as described below. Rinse blanks were evaluated manually based on the associated samples and matrices and shipments.

The appropriate qualifiers were added to the data to indicate potential concerns with data usability. These qualifiers were transferred to the data presented on tables in Section 3. The following qualifiers were added:

J – This qualifier indicates an estimated value because the associated QC data indicated a potential laboratory or matrix problem or interference. In addition, J flags assigned by the laboratory to chemical data indicate the results are below the PQL but above the instrument detection limit (IDL) or method detection limit (MDL).

R – The positive results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified. Negative radiochemical results with absolute values greater than their 2-sigma uncertainty were rejected in accordance with the USACE Kansas City guidance document.

U – The result is considered non-detect. The laboratory assigned this flag to analytes not present at detectable concentrations (above the IDL or MDL). The data validator assigned this flag when an analyte was considered non-detect as a result of blank contamination. If the result is above the PQL, the PQL is considered elevated.

UJ – The non-detect value is considered estimated.

UR – The non-detect results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified.

The following sections summarize the data evaluation for each phase of fieldwork.

2.1 Monitoring Well Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG.

Sample Delivery Groups for Monitoring Well (Fall 2012) Sampling	Laboratory for Fall 2012
160-817	TestAmerica St. Louis
160-863	TestAmerica St. Louis
160-888	TestAmerica St. Louis
160-899	TestAmerica St. Louis
160-916	TestAmerica St. Louis
160-933	TestAmerica St. Louis
160-945	TestAmerica St. Louis
160-950	TestAmerica St. Louis

2.1.1 Field Data Quality Evaluation

Table 2.1-1 provides a summary of the field QC samples and the associated field samples. Table 2.1-2 provides summarizes the sample collection frequency for the field QC samples by method.

Table 2.1-1 Field QC Associations for Monitoring Well Sampling (Fall 2012), Sylvania Corning FUSRAP Site

Key:
EB = Equipment Blank.
TB = Trip Blank.
FD = Field Duplicate.

Table 2.1-2 Field QC Samples by Method for Monitoring Well Sampling (Fall 2012), Sylvania Corning FUSRAP Site

Analytical Method	Matrix	Number of Primary Samples	Number of Field Duplicates	Frequency	Number of Trip Blanks	Number of Field Blanks
6010B	Groundwater	177	18	10%	NA	5
8260B SIM	Groundwater	177	18	10%	10	5
ASTM D 5174	Groundwater	177	18	10%	NA	5

Key:
NA = Not applicable.

2.2.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 4 of the DUSR. Overall, field duplicate precision was good. RPD criteria were exceeded for one of the field duplicate samples. Results of 1,4-dichlorobenzene in W-25-150-R2 were qualified as estimated.

2.2.1.2 Rinsate Blanks

Rinsate samples were collected at a rate of one every 35 groundwater samples. The bulk of the groundwater sampling equipment was dedicated pumps and tubing. Low levels of acetone were detected in all five rinsate blanks and 2-butanone, methylene chloride, and toluene were found in several rinsate blanks. In addition, cis-1,2-dichloroethene and trichloroethene were detected in RB-03-R2 and 1,4-dioxane was detected in RB-05-R2. Acetone, toluene, and methylene chloride were also detected in many of the trip blank samples

Acetone, methylene chloride, and toluene were consistently detected in the method blank samples. Acetone and methylene chloride are common laboratory reagents and the presence of acetone and methylene chloride in the rinsate blanks may be attributed to laboratory contamination and not field decontamination procedures. The deionized water used for decontamination or possibly the containers used to ship the water are additional likely sources of acetone in the rinsates not the field decontamination procedures. Acetone was not used in the field as a decontamination agent.

2.2.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Table 3 in the DUSR provides a list of sample results qualified and the reason for data qualification.

2.2.2.1 Groundwater Samples – Chemical Analysis

Method 8260B SIM

Toluene, methylene chloride, and acetone were detected in method blanks at concentrations below the reporting limits. Associated sample results were qualified "U" at the reporting limit.

Multiple surrogates were out of QC limits for samples MW-50I-R2, MW-507-GW-R2, MW-23S-R2, PW-7-4-R2MS, PW-6-2-R2, PW-6-3-R2, PW-2-6-R2, PW-2-6-R2MSD, MW-21D-R2, and TB-111312. All detections and non-detects are flagged as estimated ("J" or "UJ") in these samples.

The RPD value between laboratory control sample and laboratory control sample duplicate recoveries is outside of QC limits for acetone, 2-butanone, and 1,2,3-trichlorobenzene. Associated sample results were qualified as estimated ("J" qualifier).

Eight samples were analyzed as MS/MSDs. The RPD between the MS/MSD for methyl acetate, 4-methyl-2-pentanone, and 1,2-dibromo-3-chloropropane was outside of QC limits. Associated parent sample results were qualified as estimated ("J" qualifier).

Several sample results were qualified based on continuing calibration criteria outliers. The percent difference between the initial calibration and continuing calibration for dichlorodifluoromethane, chloroethane, chloromethane, trichlorofluoromethane is outside of QC limits for the continuing calibration across several SDGs. Non-detect results were qualified "UJ" if the calibration criteria indicated a low bias. Associated positive results were qualified "J."

Method 6010B

No qualification of the nickel results was performed.

Method ASTM D 5174

No qualification of the uranium results was performed.

Natural Attenuation Parameters

Ferrous iron and carbon dioxide have method defined holding times of 15 minutes and these analyses are typically performed in the field; however, project samples were delivered to the laboratory for ferrous iron and carbon dioxide analysis. Therefore, results of ferrous iron and carbon dioxide were analyzed outside of holding time and have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time.

Hydrogen for samples MW-206-302-R2, MW-22S-R2, W-27-285-R2, MW-207-170-R2, W-18-150-R2, and W-10-120-R2 were analyzed outside of the 14-day, but within 2x, the method recommended holding time.

Lactic acid, propionic acid, and pyruvic acid were outside of the QC limits for the MS/MSD prepared with project sample MW-12-R2. Results for MW-12-R2 have been qualified as estimated ("UJ" qualifier).

Alkalinity was detected in the method blank associated with samples MW-207-170-R2, W-10-120-R2, MW-14S-R2, MW-210-380-R2, MW-P110-440-R2, and MW-53S-R2. Results of alkalinity have been negated ("UJ") qualifier as the amount present in the samples was less than 5x the amount present in the associated method blank.

3 Data Summaries

Tables summarizing the complete results for the site samples are provided in this section. Tables summarizing the positive results only will be provided in the associated data summary report that will be submitted under separate cover after completion of Fall 2012 groundwater sampling activities. Field duplicate results are presented along with the field samples. The DUSRs for each SDG, presented in Appendix A, report the RPDs for the field duplicates and provide a summary of positive results for the QC samples outside QC criteria including positive results for method blanks and the associated data qualifiers.

Complete analytical results are provided on the CD in Appendix B.

3.1 Monitoring Well (Fall 2012) Data Summaries

Tables 3.1-1 through 3.1-3 include complete analytical results for Monitoring Well (Fall 2012) sampling conducted in October-November 2012.

Table 3.1-1 Complete Results for Monitoring Well Sampling (Fall 2012) not including Natural Attenuation Parameters, Sylvania Corning FUSRAP Site

5 Data Completeness and QA/QC Problems

This section summarizes the degree to which the analytical systems met or failed the data quality objectives (DQOs) listed in the QAPP. A discussion is provided for each phase of fieldwork.

5.1 Fall 2012 Groundwater Data Completeness

5.1.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.1-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 100% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.1-1 Summary of Data for Monitoring Well Sampling (Fall 2012), Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	R	Total	Rejected
Water	SW6010C	16	27	156	0	0	199	0%
	SW8260C	345	556	9010	593	0	10504	0%
	ASTM D5174	74	0	125	0	0	199	0%
Totals		**435**	**583**	**9291**	**593**	**0**	**10902**	**0%**

5.1.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Field duplicate sample precision for a minority of the analytes was not within QC criteria. Field duplicate sampling procedures does not appear to be a concern.
- The laboratory did not spike the full list of compounds into all MS/MSD pairs, however all Compounds of Concern were spiked and did not indicate any problems with the analysis.

- Calibration %D was exceeded for a minority of the analytes, this did not indicate a gross analytical issue with the laboratory analysis

- Acetone, and toluene were consistently detected in the method blank samples were consistently detected in the laboratory method blanks at concentrations above the MDL but below the reporting limit. Toluene is not considered a common laboratory contaminant. Concentrations detected in the field samples were consistent with the method blank levels. None of the affected levels were above the PQL, and therefore should not impact data usability significantly.

- Low levels of Acetone, and Toluene were detected in the trip blank samples. However this can be attributed to the above mentioned method blank contamination, and does not impact data usability.

- Several compounds were detected in the rinsate blank samples. These detections did cause some compounds to be qualified as non-detect but they were not compounds of concern, and as such should not impact data usability.

- Some matrix effects were noted for varying analytes in the MS/MSD. There are no recommended changes for problems based on sample matrix.

- Some analytes in the LCS/LCSD were out of QC criteria, and exceeded RPD limits, however they were not compounds of concern, and therefore should not impact data usability significantly.

5.2 Groundwater Data Completeness for Natural Attenuation Parameters

5.2.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.2-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.2. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the data are useable. The completeness goals for the project were met based on this percentage.

Table 5.1-2 Summary of Data for Monitoring Well Sampling (Fall 2012) Natural Attenuation Parameters, Sylvania Corning FUSRAP Site

Sample	Lab Method ID	Not Qualified	J	U	UJ	Total	Rejected
Water	3810M	2	2	29	0	33	0.0%

Totals		**117**	**33**	**137**	**10**	**297**	**0.0%**

5.2.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Ferrous iron and carbon dioxide have method defined holding times of 15 minutes and these analyses are typically performed in the field; however, project samples were delivered to the laboratory for ferrous iron and carbon dioxide analysis. Therefore, results of ferrous iron and carbon dioxide were analyzed outside of holding time and have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time.

- Lactic acid, propionic acid, and pyruvic acid were outside of the QC limits for the MS/MSD prepared with project sample MW-12-R2. Results for MW-12-R2 have been qualified as estimated.

- Alkalinity was detected in the method blank associated with samples MW-207-170-R2, W-10-120-R2, MW-14S-R2, MW-210-380-R2, MW-P110-440-R2, and MW-53S-R2. Results of alkalinity have been negated qualifier as the amount present in the samples was less than 5x the amount present in the associated method blank.

A Data Usability Summary Reports

This page intentionally left blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-817-1**
Date Completed: 1/7/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-817-1**
Date Completed: 1/7/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Multiple compounds present in associated Method Blank. Acetone and methylene chloride were detected in the trip blank. Acetone and methylene chloride were detected in associated rinsate blank RB-01-R2.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – RPD for 4-methyl-2-pentanone is outside of QC limits. Associated parent sample is qualified "J" as estimated for this compound.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - RPD for acetone and methyl tert-butyl ether is outside of QC limits. Associated results for project samples have been qualified as estimated.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-817-1**
Date Completed: 1/7/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Two samples were analyzed at a dilution due to high concentration of target analytes.
Do field duplicate results show good precision for all compounds? See Table 4	There are no field duplicates associated with this SDG.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-817-1**
Date Completed: 1/7/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 4	Yes – There were three field duplicate and parent sample pairs, all samples were non-detect, no qualification of the data is necessary.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples were reanalyzed with a post spike to confirm that quenching was not occurring. The original results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - Dichlorodifluoromethane and chloromethane are outside of the upper QC limit. The samples associated with this CC are non-detections. No qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-817-1**
Date Completed: 1/7/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
The %RSD for LCS/LCSD and MS/MSD qualified analytes as estimated “J”. No impact on data usability was observed.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The relative percent difference (RPD) between the matrix spike and the matrix spike duplicate is outside of QC limits.
3 - The reported result has been qualified as estimated. The RPD between the laboratory control sample and the laboratory control sample duplicate is outside of QC limits.
4 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip blank.
5 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated rinsate blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-863**
Date Completed: 1/21/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-863**
Date Completed: 1/21/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Several compounds were found in the method blanks for the batches for SW8260. There were also several detections in the trip blank for this batch.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several compounds were flagged as non-detect due to detection in the method blanks. No analytes were flagged due to trip blank contamination. Acetone and Methylene Chloride were detected in associated rinsate blank RB-01-R2
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes – MS/MSD RPD for one compound was greater than QC limits causing qualification of the data.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes – LCS/LCSD RPD for one compound was greater than QC limits causing qualification of the data.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-863**
Date Completed: 1/21/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were analyzed at dilution due to high concentration of target analytes, only one result is reportable for each sample.
Do field duplicate results show good precision for all compounds? See Table 4	Yes – VOC compounds showed good agreement with each other in the field duplicate and parent samples, no Ni was detected in any of the duplicate/parent samples, no qualification of the data is necessary.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	NA
Any compounds present in method and field blanks? See Table 3	NA
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	NA
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	NA
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	NA

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-863**

Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 4	NA
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	NA

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-863**
Date Completed: 1/21/2013	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
Analytes were qualified due to method blank contamination, MS/MSD RPD, and LCS/LCS RPD.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

2 - The reported result has been qualified as estimated. The relative percent difference (RPD) between the matrix spike and the matrix spike duplicate is outside of QC limits.
3 - The reported result has been qualified as estimated. The RPD between the laboratory control sample and the laboratory control sample duplicate is outside of QC limits.
4 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated rinse blank.

Table 4
Summary of Field Duplicate Results
Sylvania Corning FUSRAP
SDG: 160-863-1

Primary Sample ID: PW-4-7-R2 Lab ID: 160-863-10
Duplicate Sample ID: MW-500-GW-R2 Lab ID: 160-863-12

Method	Analyte	PW-4-7-R2	MW-500-GW-R2	RPD	Rating	Qualifier
SW8260	1,1,1-TRICHLOROETHANE	0.11	0.13	16.7	Good	None

Primary Sample ID: MW-208-350-R2 Lab ID: 160-863-13
Duplicate Sample ID: MW-501-GWR2 Lab ID: 160-863-14

Method	Analyte	MW-208-350-R2	MW-501-GWR2	RPD	Rating	Qualifier
SW8260	TETRACHLOROETHENE	110.0	110	0.0	Good	None
SW8260	TRICHLOROETHENE	110.0	110.0	0.0	Good	None
SW8260	1,1,1-TRICHLOROETHANE	0.1	0.1	0.0	Good	None

SW8260	TRICHLOROETHENE	0.91	0.84	8.0	Good	None

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-888**
Date Completed: 01/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-888**
Date Completed: 01/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of Acetone were detected in MB 160-16767/2. Low levels of 1,2,3 and 1,2,4-Trichlorobenzene were detected in MB 160-16768/2 Low levels of 2-Hexanone and Acetone were detected in MB 160-16963/2 Acetone and Methylene Chloride were detected in RB-01. Acetone (U qualified due to MB contamination) and low level of Toluene were detected in TB-110812.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified non-detect for Acetone in Batch 16767. Sample MW-205-470-R2 result for Toluene qualified due to Trip Blank Contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No – Several surrogates for PW-7-6-R2 and PW-7-7-R2 as well as MSD for batch16767 were recovered high. Samples were not reanalyzed, detections in the field samples are qualified “J” as estimated due to this non-conformance.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then “R” flag associated non-detect values.*	No – MS/MSD for bat 16767 RPD was non-compliant for 1,2-Dibromo-3-Chloropropane, no positive results in this batch no qualification of the data necessary.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-888**
Date Completed: 01/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – several samples were diluted due to high concentrations of target analytes, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	Yes – VOC analysis showed good precision across all detected analytes. Nickel was not detected in any of the field duplicate/parent sample pairs and was not qualified.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-888**
Date Completed: 01/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were reanalyzed due to failure of R2 or lifetime and assessed for quenching. No quenching was observed and the initial results are reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-888**
Date Completed: 01/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No – Chloroethane was greater than 20% for ICV 16238/9 associated samples are flagged "J" or "UJ" as estimated. Trichlorofluoromethane was greater than 20% for ICV 16770/3 associated samples are flagged "J" or "UJ" as estimated.
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
Results qualified due to Method, Trip, and Rinsate Blank contamination, high surrogate recovery, and GC/MS CCV recovery.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characteriztion – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-899**
Date Completed: 1/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characteriztion – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-899**
Date Completed: 1/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Alkalinity for sample 160-899-1 was analyzed outside of holding time but within 2x the holding time. Ferrous iron and carbon dioxide have method defined holding times of 15 minutes and these analyses are typically performed in the field; however, project samples were delivered to the laboratory for ferrous iron and carbon dioxide analysis. Therefore, results of ferrous iron and carbon dioxide were analyzed outside of holding time and have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Acetone was detected in MB 160-16767/2. 2-Hexanone and Acetone were detected in MB 160-16963/2.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Samples associated with MB 160-16767/2 are flagged “U” as non-detect for Acetone if less than 10 times the amount in the blank. Samples associated with MB 160-16963/2 are flagged “U” as non-detect for Acetone if less than 10 times the amount in the blank, and less than 5 times the amount of 2-Hexanone.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No – Multiple surrogates were out of QC limits for samples MW-50I-R2, MW-507-GW-R2, and MW-23S-R2. All detections and non-detects are flagged as estimated “J” or “UJ” in these samples.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characteriztion – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-899**
Date Completed: 1/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – RPD for MS/MSD of MW-50I-R2 for 1,2-Dibromo-3-Chloropropane is qualified "UJ" as estimated. The MS/MSD prepared with 160-899-1 was outside of QC limits for nitrate/nitrite due to high concentrations in the native sample relative to the spike amount. No qualification has been performed.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No
Do field duplicate results show good precision for all compounds? See Table 4	

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No

Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were reanalyzed due to failure of R2 or lifetime to test for quenching. No evidence of quenching found results are reported. Several other samples were diluted due to high concentrations of target analytes, only one result is reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characteriztion – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-899**
Date Completed: 1/22/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
Results qualified due to Method blank contamination, surrogate recovery, and MS/MSD RPD.

Key:

AP = Acid Phenol
BN = Base Neutral

CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The relative percent difference (RPD) between the matrix spike and the matrix spike duplicate is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-916**
Date Completed: 1/23/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-916**
Date Completed: 1/23/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes – Ferrous iron and carbon dioxide have method defined holding times of 15 minutes and these analyses are typically performed in the field; however, project samples were delivered to the laboratory for ferrous iron and carbon dioxide analysis. Therefore, results of ferrous iron and carbon dioxide were analyzed outside of holding time and have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Acetone and 2-Hexanone were detected at low levels in MB 160-17161/2. Acetone was detected in low levels in MB 17602/2. Iron was detected in MB 160-17827/1-A.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Acetone in both 17161 and 17602 in multiple samples was qualified as non-detect “UJ”. Iron in sample 160-916-1 and -2 was qualified as non-detect "UJ".
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No – Multiple surrogates for PW-7-4-R2MS, PW-6-2-R2, PW-6-3-R2, PW-2-6-R2, PW-2-6-R2MSD, MW-21D-R2, and TB-111312, samples were not reanalyzed. Detections and non-detects are qualified as estimated “J” and “UJ”.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then “R” flag associated non-detect values.*	No – Recovery for sample PW-2-6-R2 for 1,2-Dibromoethane was greater than QC limits, sample result in parent sample is qualified as estimated “J”.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-916**
Date Completed: 1/23/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – several samples required dilution prior to analysis. Only one result was reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – 1,4-Dichlorobenzene was out of QC criteria and is qualified "J" as estimated. Nickel wasn't detected in either the field duplicate or parent sample no data qualified.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	NA
Any compounds present in method and field blanks? See Table 3	NA
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	NA
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	NA

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-933**
Date Completed: 01/28/2012	**Data Validation Chemist: J. Nelson**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	N/A
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-933**
Date Completed: 01/28/2012	**Data Validation Chemist: J. Nelson**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes – Ferrous iron and carbon dioxide have method defined holding times of 15 minutes and these analyses are typically performed in the field; however, project samples were delivered to the laboratory for ferrous iron and carbon dioxide analysis. Therefore, results of ferrous iron and carbon dioxide were analyzed outside of holding time. Results of ferrous iron and carbon dioxide have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time. Hydrogen for samples MW-206-302-R2, MW-22S-R2, W-27-285-R2, MW-207-170-R2, W-18-150-R2, and W-10-120-R2 were analyzed outside of the 14-day, but within 2x, the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Alkalinity was detected in method blank 160-18623/1.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified non-detect for alkalinity.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	N/A
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	N/A

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-933**
Date Completed: 01/28/2012	**Data Validation Chemist: J. Nelson**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – The MS/MSD prepared with 160-933-1 was outside of QC limits for nitrate/nitrite due to high concentrations in the native sample relative to the spike amount. No qualification has been performed. The MS/MSD prepared with 160-933-7 was outside of QC limits for propionic, pyruvic, and lactic acid. Results for 160-933-7 were qualified as estimated.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – several samples were diluted due to high concentrations of target analytes, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	N/A

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	N/A
Any compounds present in method and field blanks? See Table 3	N/A

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-933**

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
Results qualified due to Method Blank contamination.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The relative percent recovery for the matrix spike is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-945**
Date Completed: 1/25/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-945**
Date Completed: 1/25/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of compounds present in Method, Trip, and Rinsate Blanks.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – MS/MSD recovery of trans-1,3-Dichloropropene in MW-207-170-R2 pair was high, compound is non-detect and no qualification of the data is necessary.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No – LCS/LCSD RPD recovery of 1,2,3-Trichlorobenzene was high for batch 17878, this analyte qualified "UJ" since no positive detections of this analyte were found in the batch.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-945**
Date Completed: 1/25/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	Yes – All VOC compounds showed good agreement between field duplicate and parent sample RPDs. Nickel was not detected in four of the field duplicate or parent samples and showed good agreement in the pair that it was detected in.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-945**
Date Completed: 1/25/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-945**
Date Completed: 1/25/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/30/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
VOC results qualified based on method and rinsate blank contamination, and LCS/LCSD RPD.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate

QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The RPD between the laboratory control sample and the laboratory control sample duplicate is outside of QC limits.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-950**
Date Completed: 1/31/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/31/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above BK

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-950**
Date Completed: 1/31/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/31/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low level detections were found in multiple method blanks. RB-04-R2 contains detections.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Samples from batch 18029 had several samples qualified as non-detect "U" and "UJ" for Acetone due to method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No – MW-33D-R2 1,2-Dichloroethane-d4 was recovered high, positive detections in this sample are qualified "J" as estimated.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	Yes
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-950**
Date Completed: 1/31/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/31/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples were reanalyzed, only one result is reportable.
Do field duplicate results show good precision for all compounds? See Table 4	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Fall 2012 Sampling
Laboratory: TestAmerica	**LAB SDG ID: 160-950**
Date Completed: 1/31/2012	**Data Validation Chemist: B. Kroon**
Date Performed: 1/31/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 4	Yes.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Several samples in analytical batches failed R2 and or lifetime so they were reanalyzed with a post-spike to test for quenching. No evidence of quenching was observed, initial results reported.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA

Method	**Description**	**Notes and Qualifiers**
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
Results are qualified due to method and rinsate blank contamination, and surrogate recovery.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Introduction

The Louis Berger Group, Inc. (LBG) and their subcontractor, Ecology and Environment, Inc. (E & E), have been contracted by the United States Army Corps of Engineers (USACE), under Contract Numbers W912DQ-11-D-3009, Task Order No. 0012, to perform an Off-Site Groundwater Characterization and Feasibility Study (FS) at the Sylvania Corning Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Sylvania Site or the Site) located in Hicksville, Nassau County, New York.

The study objectives are to:

- Characterize the nature and extent of off-site groundwater contamination originating from the Sylvania Site.
- Determine if groundwater contaminants from the Sylvania Site are reaching the municipal water supply wells at the Hicksville Water District Plant 5 and Bowling Green facilities.
- Collect sufficient data to select remedial alternatives and prepare a FS for remediation of the Site.

This Quality Control Summary Report (QCSR) presents the results of the sampling and analytical program and provides an opportunity to review the completeness and quality of the data collected.

The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling investigation conducted (see Section 1);
- Identify any deviations from the proposed sampling and analysis procedures (see Sections 1 and 2);
- Present the analytical results for the field samples collected (see Section 3);
- Report on any inspections or audits performed and any findings that that may impact the project data (see Section 4); and

- Discuss the results of the data quality evaluation associated with the sampling events (see Sections 2 and 5).

Evaluation of any contaminants detected will be provided in a separate Data Summary Report and the RI Report. The report also will contain maps of sample locations and summary tables of positive results.

Supporting information is included in appendices to the QCSR. The appendices are located on the attached DVD and include:

- Appendix A –Data Usability Summary Report (DUSR) – The DUSR prepared for each sample delivery group (SDG) in PDF format.

- Appendix B – Analytical Data – All laboratory reports in PDF format which include case narratives and quality control (QC) sample results. The compact disc also includes a database of the final validated data in Electronic Data Management System (EDMS) format.

- Appendix C – Sample Collection Documentation – Daily activity summary reports (on CD), and field adjustment forms which document deviations from the planned activities. This appendix also will include any audits performed.

1 Data Collection

Environmental samples were collected as part of the field characterization in accordance with the final Work Plan, Health and Safety Plan, and Quality Assurance Project Plan, Off-Site Groundwater Characterization and Feasibility Study for the Sylvania Corning FUSRAP Site (USACE May 2011). Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; and containerization of investigation-derived waste (IDW) were performed in accordance with the WP, QAPP, and documents referenced therein. All field QC activities were carried out in accordance with the final Quality Control Plan (QCP) (USACE May 2011). The contents of this QCSR summarized the Spring 2013 area wide sampling event that included collection of samples from 176 monitoring wells and the Summer 2013 area wide sampling event that included collection of samples from 150 monitoring wells.

Quality assurance/quality control (QA/QC) samples were collected on a site-wide basis according to the criteria established in the QAPP. The field QA/QC sample requirements are as follows:

- Field QC duplicates collected at a frequency of 10% of the number of field samples collected;
- Rinsates collected at a frequency of 10% of the number of field samples collected if non-dedicated equipment was used;
- Matrix spike/matrix spike duplicate (MS/MSDs) for laboratory QC collected at a frequency of 5% of the sample collected; and
- Trip blanks sent one per shipment for each cooler that included water samples for volatile analysis. Trip blanks were analyzed for all volatile methods designated for the samples.

Any minor variances in field methodologies that occurred during the characterization are noted on the daily activity summary reports or in the field logbook. Deviations from the WP were noted on field adjustment forms. Copies of these reports and forms are provided in Appendix C. The following sections summarize the deviations and fieldwork activities.

1.1 Off Site Groundwater Characterization Data Collection

This section of the QCSR summarizes the results of two area wide monitoring well sampling events for the Off Site Groundwater Characterization – the Spring 2013 and Summer 2013 events. This consisted of sampling of 91 USACE monitoring wells, 11 wells installed by GTEOSI, 39 wells installed as part of the General Instruments inactive hazardous waste site investigation, and 35 samples collected from 5 multiport wells installed as part of the Anchor Chemical inactive hazardous waste site investigation during the Spring 2013 event (176 total samples). The Summer 2013 event consisted of the same well set with the addition of one GI well not previously sample (W-34-285) and a reduction of Anchor Chemical wells sampled (9 samples from 3 multiport wells) for a total of 150 samples. The Spring 2013 event was conducted between 10 April and 25 April 2013 and the Summer 2013 event was conducted between 13 August and 29 August 2013. The groundwater sampling procedures were performed in accordance with the final Work Plan (USACE May 2011) and Work Plan Addendum (USACE 2013). Deviations to sampling procedures are presented in Appendix C. Summaries of the exceptions and notable changes from previous sampling events are described below:

Both Spring 2013 and Summer 2013:

- The multiport Anchor Chemical wells have seven small ports in a two inch well. When a pump is installed to purge the well there is not room to install a water level meter to monitor the water level conditions during purging as required if using low flow sampling techniques. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- Monitoring well W-10-120 has an obstruction in the well and no sampling equipment could be installed to reach the well screen to allow for low flow sampling. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- The EPA Region 2 low flow sampling techniques do not require any minimum purge volume. Given the depth of the monitoring wells and amount of sample tubing required to reach the monitoring well screen depth (up to 570 feet BGS), the volumes of "stagnant" water contained within sampling devices can be several gallons. Given the purge rates of low flow sampling (less than 500 mls/min) it is conceivable that sample parameters could show stabilization and the well could be sampled prior to evacuating all "stagnant" water contained within the pumping device. This could provide a sample that is not representative of aquifer conditions. After review of USACE KC low flow

techniques, the USACE team decided to require that a minimum of two volumes of water contained within the pumping device be removed prior to determining stabilization of parameters for sampling to ensure representative samples are collected.

- General instruments well W-15-168 could not be located and therefore was not sampled.

Spring 2013 Only:

- A significant amount of silt was found in monitoring well W-25-188 when sampling was first attempted. This well is located in a low spot where silts accumulate during rain events. The well cap had not been properly secured during a previous sampling event and the silts were allowed to accumulate in the well (not a USACE sampling event). This well was redeveloped prior to sampling.

Summer 2013 Only:

- The schedule for sampling of Anchor Chemical multiport wells was reduced to samples from three ports from three separate wells for nine total samples as documented in the November 2013 Work Plan Addendum.

- As a result of the limited extent of uranium contaminants in the aquifer, the schedule for analyzing samples for total uranium was limited to 104 rather than all samples as had previously been done. These samples were all collected from wells located adjacent to West John Street and northward to include the entirety of the Sylvania-Corning and GI sites.

- Isotopic uranium samples were collected from 10 wells that had exhibited uranium contamination previously. This was done to evaluate the nature of the uranium contamination and to compare with previously documented isotopic uranium analyses.

- Groundwater samples from 30 monitoring wells were analyzed for compounds specific isotope analysis (CSIA) for both PCE and TCE. This information will be used to help determine the source of contaminants in the mixed plume areas downgradient of the Sylvania site. CSIA results were not addressed as part of this QCSR.

- Groundwater samples from all monitoring wells were analyzed for ferrous iron in the field using a Hach kit. In addition, 15 duplicate ferrous iron samples were collected for analysis by Test America. This QCSR discusses the QA/QC issues related only to the 15 duplicate ferrous iron samples analyzed by Test America.

- GI monitoring well W-34-285 had not been sampled during previous USACE sampling events because of known obstruction within the well that does not allow for installation of a bladder pump. This well was sampled during this round with a Waterra inertial lift pump which only requires tubing to be installed which is not likely to get stuck on the obstruction in the well.

- FedEx misplaced a sample cooler during shipment to the laboratory. This resulted in the samples arriving at the lab above recommended temperatures. These samples were not analyzed and the entire shipment was re-sampled (11 total).

1.1.1 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP (USACE May 2011). There were no deviations from the WP regarding sample handling or custody except for the following:

- The WP states that all samples were to be stored on ice at temperatures between 2 and 4 degrees Celsius. The total uranium analysis SOP does not require icing of samples and therefore were not placed or stored on ice.

- In table 3.2-2 of the WP, the analytical method EPA Method 200.8 is referred to as the selected method for total uranium analysis. It was decided by the USACE team to use ASTM D5174 (KPA) after the submission of the Final WP.

1.1.2 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in LBG's QAPP. There were no deviations from the QAPP with regard to equipment calibration and maintenance.

1.1.3 Equipment Calibration and Maintenance

Samples were shipped to approved laboratories for analysis. Analytical methods in support of the Off Site Groundwater Characterization activities are referenced in the QAPP. GEL Laboratories of Charleston, SC provided total uranium for all monitoring well samples. Test America of Earth City, MO provided analysis for volatile, nickel, isotopic uranium, and ferrous iron. The CSIA analysis was performed by Microseeps in Pittsburgh, PA. Table 1-1 lists all of the analyses performed and the number of samples collected for methods for the investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-1 Summary of Analytical Methods and Samples Collected for Off Site Groundwater Characterization, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Lab Method Description	Number of Samples Analyzed
Groundwater – Monitoring Wells - Spring 2013	6010B	Method 6010B – Total Metals, Ni only	176 samples, 18 dups, and 5 rinse blanks
	6010B	Method 6010B - Dissolved Metals, Ni only	3 samples
	8260B	Method 8260B – Volatile Organic Compounds by GC/MS in Water	176 samples, 18 dups, 5 rinse blanks, and 8 trip blanks
	ASTM D 5174	Total Uranium	176 samples, 18 dups, and 5 rinse blanks
	ASTM D 5174	Dissolved Uranium	3 samples
Groundwater - Monitoring Wells - Summer 2013	6010B	Method 6010B - Total Metals, Ni only	150 samples, 15 dups, and 3 rinse blanks
	6010B	Method 6010B - Dissolved Metals, Ni only	1 sample
	8260B	Method 8260B - Volatile Organic Compounds by GC/MS in Water	15 samples, 15 dups, 3 rinse, blanks, and16 trip blanks
	ASTM D 5174	Total Uranium	104 samples, 11 dups, and 1 rinse blank
	A-01-R	Isotopic Uranium	10 samples and 1 dup
	SM 3500 FE D	Iron, Ferrous and Ferric	17 samples
		Compound Specific Isotope Analysis (PCE/TCE)	30 samples and 3 dups

2 Data Analysis and Validation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, COC documents, statements in the laboratory case narratives, and field notebooks. Laboratory activities were conducted in accordance with the QAPP. The target compounds, practical quantitation limits (PQLs), and QC limits for the project were reviewed in accordance with the QAPP. Field duplicate and blank data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods. The final validated data was stored in an Environmental Quality Information Systems (EQuIS) format database.

LBG/E & E performed data review and validation of samples in accordance with the QAPP. The data review tasks completed for this project include:

- **Completeness.** LBG/E & E performed a completeness check on all EDDs and compared the data to the hard copy deliverable to verify the data were reported consistently.

- **Compliance.** LBG/E & E reviewed the laboratory reports and EDDs, checked the hard copy reports and case narratives, and verified the EDD data submitted matched the hard copy data packages. LBG/E & E reviewed calibration information and compound identification results in the raw data package and entered the qualifiers.

- **Reporting.** LBG/E & E assigned data qualifiers and flagged all reportable data with review from LBG. Results of the data review are summarized in the DUSR in Appendix A. The DUSR contain a summary of the data that was qualified, and tables of the QC samples that did not meet applicable limits.

- **Data Management.** LBG/E & E developed a project-specific database with all validated data stored in EQuIS format. LBG/E & E developed reporting tables through the use of the EQuIS database. LBG/E & E generated summary tables of final qualified data in Excel spreadsheets as shown in Section 3. Databases are provided in Appendix B.

QC samples were collected to assess the quality of the field sampling activities as described in Section 1. The evaluation of these samples was based on complete-

ness of data, positive results of equipment and trip blank analysis, and relative percent differences (RPDs) of field duplicate results. ADR was used to evaluate field duplicates. Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. The field duplicate QC criteria are 40% for aqueous samples, and 70% for soil samples. The RPD ratings are listed as "Good" if the RPD is less than field duplicate QC criteria and as "Poor" if the RPD exceeded the field duplicate QC criteria. Data were qualified "J" as estimated based on the data reviewers overall evaluation of field precision and accuracy. The qualification of data because of field duplicates is discussed at the end of each DUSR.

Rinse blanks were evaluated for each phase of sampling as described below. Rinse blanks were evaluated manually based on the associated samples and matrices and shipments.

The appropriate qualifiers were added to the data to indicate potential concerns with data usability. These qualifiers were transferred to the data presented on tables in Section 3. The following qualifiers were added:

J – This qualifier indicates an estimated value because the associated QC data indicated a potential laboratory or matrix problem or interference. In addition, J flags assigned by the laboratory to chemical data indicate the results are below the PQL but above the instrument detection limit (IDL) or method detection limit (MDL).

R – The positive results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified. Negative radiochemical results with absolute values greater than their 2-sigma uncertainty were rejected in accordance with the USACE Kansas City guidance document.

U – The result is considered non-detect. The laboratory assigned this flag to analytes not present at detectable concentrations (above the IDL or MDL). The data validator assigned this flag when an analyte was considered non-detect as a result of blank contamination. If the result is above the PQL, the PQL is considered elevated.

UJ – The non-detect value is considered estimated.

UR– The non-detect results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified.

The following sections summarize the data evaluation for each phase of fieldwork.

2.1 Monitoring Well Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG.

Sample Delivery Groups for Monitoring Well Sampling - Spring 2013	Laboratory for Spring 2013

SM 3500 FE D	Groundwater	15	1	6.7%	NA	NA

Key:
NA = Not applicable.

2.2.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 4 of the DUSR. Overall, field duplicate precision was good for both the Spring 2013 and Summer 2013 Monitoring Well Sampling events.

During the Spring 2013 sampling event RPD values for total uranium were outside of QC limits for MW-28I-SP13 and MW-208-350-SP13 and tetrachloroethene was outside of QC limits for MW-33S-SP13. Sample results have been qualified as necessary.

In addition, duplicate sample MW-807-SP13 was collected twice; once on April 19, 2013 (160-2163-28) and again on April 22, 2013 (160-2187-13). The location of the parent sample for duplicate 160-2163-28, collected on April 19, was not recorded in either the well purge records or field log book during the time of sampling and therefore, the identity of the parent sample could not be accurately determined. When the error was discovered, sample MW-807-SP13 was recollected on April 22, 2013 (160-2187-13); however, sample 160-2163-28 had already been delivered to the laboratory for analysis. As a result, both samples 160-2163-28 and 160-2187-13 have been reported although only sample 160-2187-13 and its parent sample PW-07-01-SP13 (160-2187-12) are being used for site characterization and QC purposes.

2.2.1.2 Rinsate Blanks

Rinsate samples were collected at a rate of one every 35 groundwater samples during the Spring 2013 monitoring well sampling event and at a rate of one every 50 groundwater samples during the Summer 2013 monitoring well sampling event. The bulk of the groundwater sampling equipment during both sampling events was dedicated pumps and the samples collected from the dedicated pumps are not associated with the rinsate blanks collected during either the Spring 2013 or Summer 2013 monitoring well sampling events.

Spring 2013 Only:

Low levels of acetone were detected in all five rinsate blanks and chloroform, toluene, and 1,2,4-trichlorobenzene were found in several rinsate blanks. In addition

2-hexanone, cyclohexane, and methylene chloride were detected in RB-02-SP13; 1,4-dioxane was detected in RB-04-SP13; and tetrachloroethene was detected in RB-05-SP13. Acetone was also detected in many of the trip blank samples.

Acetone and 1,2,4-trichlorobenzene were consistently detected in the method blank samples. Acetone is a common laboratory reagent and the presence of acetone in the rinsate blanks may be attributed to laboratory contamination and not field decontamination procedures. The deionized water used for decontamination or possibly the containers used to ship the water are additional likely sources of acetone in the rinsates not the field decontamination procedures. Acetone was not used in the field as a decontamination agent.

Summer 2013 Only:

Low levels of acetone were detected in all three rinsate blanks and toluene was detected in both RB-01-SU13 and RB-02-SU13. In addition, 2-butanone, chloromethane, cis-1,2-dichloroethene, and tetrachloroethene were detected in RB-01-SU13. Acetone was also detected in many of the trip blank samples.

Acetone was consistently detected in the method blank samples and the presence of acetone in the rinsate samples may be attributed to laboratory contamination and/or the containers used to ship the deionized water used during field decontamination. Acetone was not used in the field as a decontamination agent.

2.2.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Table 3 in the DUSR provides a list of sample results qualified and the reason for data qualification.

2.2.2.1 Spring 2013 Groundwater Samples – Chemical Analysis

Method 8260B SIM

Acetone, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene were detected in method blanks at concentrations below the reporting limits. Associated samples were qualified ("J" or "UJ" qualifier) based on the level of blank contamination versus the amount present in the project sample.

The laboratory control sample recovery is outside of QC limits for methylcyclohexane in SDG 160-2198. Associated sample results were qualified as estimated ("J" or "UJ" qualifier).

Nine samples were analyzed as MS/MSDs. High recovery of 1,1,1-trichloroethane was reported in the MS/MSD prepared with sample PW-03-02-SP13 (160-2112-20). Associated parent sample results were qualified as estimated ("J" qualifier). Low recovery of methyl acetate was reported for the MS/MSD pair prepared with project sample MWP-114-290-SP13 (160-2187-30). Results of methyl acetate for the associated project sample have been qualified as estimated ("J" qualifier).

The percent difference between the initial calibration and continuing calibration for 2-hexanone is outside of QC limits for the continuing calibration in SDG 160-2163. Additionally, acetone, methyl acetate, methyl tert-butyl ether, 2-butanone, 4-methyl-2-pentanone, 2-hexanone, and 1,1,2,2-tetrachloroethane are outside of QC limits for SDG 160-2198. Non-detect results were qualified “UJ” if the calibration criteria indicated a low bias. Associated positive results were qualified “J”.

The laboratory made a reporting error regarding the dilution of field duplicate sample MW-812-SP13 (160-2198-20) for tetrachloroethene. At present, there is no way for the laboratory to tell if this was a data entry error in the volume recorded, or if it was re-analyzed at the wrong dilution. Screening data for both samples – not reportable because QC is not run during a screen – indicated that duplicate sample MW-812-SP13 (160-2198-20) and its parent sample MW-33S-SP13 (160-2198-22) had approximately 1400 ppb of tetrachloroethene. The run logs indicate a 1:25 dilution was performed on sample MW-812-SP13 (160-2198-20). The re-run should have been done at 1:100 dilution. The sample vials are no longer available to check the actual volumes removed from the vial to see if the volumes recorded were in error. As there is no definitive means to check the actual volume used, the data has to be reported with the 1:25 dilution and therefore, results of tetrachloroethene for sample MW-812-SP13 (160-2198-20) have been rejected ("R" qualifier). Sample MW-812-SP13 (160-2198-20) was not recollected in the field and with the exception of tetrachloroethene all results for sample MW-812-SP13 (160-2198-20) are considered usable.

Method 6010B

The analytical report for Method 6010B was reviewed, and no change to the laboratory reported qualifiers was required.

Method ASTM D 5174

The analytical report for Method ASTM D 5174 was reviewed, and no change to the laboratory reported qualifiers was required.

2.2.2.2 Summer 2013 Groundwater Samples – Chemical Analysis

Method 8260B SIM

Acetone was detected in method blanks at concentrations below the reporting limits. Associated samples were qualified ("J" or "UJ" qualifier) based on the level of blank contamination versus the amount present in the project sample.

Eight samples were analyzed as MS/MSDs. Low recovery of 1,2,3-trichlorobenzene was reported in the MS/MSD prepared with sample MW-15S-SU13 (160-3429-8). Associated parent sample results were qualified as estimated ("J" qualifier).

Method 6010B

The analytical report for Method 6010B was reviewed, and no change to the laboratory reported qualifiers was required.

Method ASTM D 5174

The analytical report for Method ASTM D 5174 was reviewed, and no change to the laboratory reported qualifiers was required.

Method A-01-R

Tracer recovery is outside of QC limits for sample MW-18S-SU13 (160-3414-13). Results have been qualified as estimated ("J" qualifier).

Method SM 3500 FE D

The analytical report for Method SM 3500 FE D was reviewed, and no change to the laboratory reported qualifiers was required.

3 Data Summaries

Tables summarizing the complete results for the site samples are provided in this section. Tables summarizing the positive results only will be provided in the associated data summary report that will be submitted under separate cover in Appendix A. Field duplicate results are presented along with the field samples. The DUSRs for each SDG, presented in Appendix A, report the RPDs for the field duplicates and provide a summary of positive results for the QC samples outside QC criteria including positive results for method blanks and the associated data qualifiers.

Complete analytical results are provided on the CD in Appendix B.

3.1 Spring 2013 and Summer 2013 Monitoring Well Data Summaries

Tables 3.1-1 through 3.1-4 include complete analytical results for the Spring 2013 Monitoring Well sampling conducted in April 2013 and the Summer 2013 Monitoring Well sampling conducting in August 2013.

Table 3.1-1 Complete Results for Spring 2013 Monitoring Well Sampling, Sylvania Corning FUSRAP Site

J = Estimated Value

4 System Audits

A field audit was scheduled for the Summer 2013 monitoring well sampling event. The audit is summarized in Table 4-1 and included in Appendix C. No field audit was performed during the Spring 2013 monitoring well sampling event.

Table 4-1 Summary of System Audits

Audit Dates	Company	Scope of Audit and Summary of Findings
8/19/2013	LBG	A field audit of the health and safety, sampling, decontamination, and shipping procedures was performed during the Summer 2013 Monitoring Well sampling event. Field logbooks, sample COCs, and instrument calibration logs were reviewed. Minor deviations from the WP were noted and corrected.

This page intentionally left blank.

5 Data Completeness and QA/QC Problems

This section summarizes the degree to which the analytical systems met or failed the data quality objectives (DQOs) listed in the QAPP. A discussion is provided for each phase of fieldwork.

5.1 Spring 2013 Groundwater Data Completeness

5.1.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.1-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 99.99% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.1-1 Summary of Data for Spring 2013 Monitoring Well Sampling, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	R	Total	Rejected
Water	SW6010C	17	17	168	0	0	202	0%
	SW8260C	359	674	9543	187	1	10764	0.01%
	ASTM D5174	69	8	125	0	0	202	0%
Totals		**445**	**699**	**9836**	**187**	**1**	**11168**	**0.01%**

5.1.2 QC Summary and Recommended Changes

Field Sampling Problems

- Duplicate sample MW-807-SP13 was collected twice (160-2163-28 and 160-2187-13) due to inaccurate field records. Results for both samples have been reported; however, only sample 160-2187-13 and its parent sample PW-07-01-SP13 (160-2187-12) are being used for site characterization and QC purposes.

Analytical Method Problems

The following issues were noted with the analytical methods used for the samples collected:

- Field duplicate sample precision for a minority of the analytes was not within QC criteria. Field duplicate sampling procedures does not appear to be a concern.

- The laboratory did not spike the full list of compounds into all MS/MSD pairs, however all Compounds of Concern were spiked and did not indicate any problems with the analysis.

- Calibration %D was exceeded for a minority of the analytes, this did not indicate a gross analytical issue with the laboratory analysis

- Acetone, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene were consistently detected in the method blank samples at concentrations above the MDL but below the reporting limit. 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene are not considered a common laboratory contaminants. Concentrations detected in the field samples were consistent with the method blank levels. None of the affected levels were above the PQL, and therefore should not impact data usability significantly.

- Low levels of acetone were detected in the trip blank samples. However this can be attributed to the above mentioned method blank contamination, and does not impact data usability.

- Several compounds were detected in the rinsate blank samples. These detections did cause some compounds to be qualified as non-detect but they do not impact data usability.

- Some matrix effects were noted for varying analytes in the MS/MSD. There are no recommended changes for problems based on sample matrix.

- Some analytes in the LCS/LCSD were out of QC criteria; however, they were not compounds of concern, and therefore should not impact data usability significantly.

- Results of tetrachloroethene in sample MW-812-SP13 (160-2198-20) were rejected. The laboratory cannot confirm that the proper dilution was used during sample preparation and therefore the final reported result could not be confirmed.

5.2 Summer 2013 Groundwater Data Completeness

5.2.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.2-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.2. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the

data are useable. The completeness goals for the project were met based on this percentage.

Table 5.2-1 Summary of Data for Summer 2013 Monitoring Well Sampling, Sylvania Corning FUSRAP Site

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	R	Total	Rejected
Water	SW6010C	20	16	132	0	0	168	0%
	SW8260C	265	630	8475	146	0	9516	0%
	ASTM D5174	44	2	70	0	0	116	0%
	A-01-R	23	6	7	0	0	36	0%
	SM 3500 FE D	6	2	9	0	0	17	0%
Totals		**358**	**656**	**8693**	**146**	**0**	**9853**	**0%**

5.2.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

The following issues were noted with the analytical methods used for the samples collected:

- Ferrous iron has method defined holding times of 15 minutes and these analyses are typically performed in the field; however, 15 duplicate samples were delivered to the laboratory for ferrous iron. Therefore, results of ferrous iron were analyzed outside of holding time and have been given the "HF" qualifier to denote that analysis was performed outside of the method defined holding time.

- Field duplicate sample precision for a minority of the analytes was not within QC criteria. Field duplicate sampling procedures does not appear to be a concern.

- The laboratory did not spike the full list of compounds into all MS/MSD pairs, however all Compounds of Concern were spiked and did not indicate any problems with the analysis.

- Calibration %D was exceeded for a minority of the analytes, this did not indicate a gross analytical issue with the laboratory analysis

- Acetone was consistently detected in the method blank samples at concentrations above the MDL but below the reporting limit.

- Low levels of acetone were detected in the trip blank samples. However this can be attributed to the above mentioned method blank contamination, and does not impact data usability.

- Several compounds were detected in the rinsate blank samples. These detections did cause some compounds to be qualified as non-detect but they do not impact data usability.

- Some matrix effects were noted for varying analytes in the MS/MSD. There are no recommended changes for problems based on sample matrix.

- Some analytes in the LCS/LCSD were out of QC criteria; however, they were not compounds of concern, and therefore should not impact data usability significantly.

6 PARCC Summary

6.1 PARCC Parameters

Sampling and analysis were performed using methods and techniques designed to optimize and evaluate precision, accuracy, representativeness, completeness, and comparability (PARCC; the primary data quality indicators) in the data. Meeting PARCC objectives was optimized by following the work plans; using quality laboratories; and management oversight of the work. Instances of questionable QC performance were evaluated and the findings presented in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems. Additional details can be found in the Data Usability Summary Reports included in Appendix A. The PARCC parameters are defined as follows:

- **Precision.** Precision was evaluated through the use of field and analytical duplicate samples.
- **Accuracy.** Accuracy was evaluated through the use of analytical standards, QC samples such as spikes and LCSs, and blank samples.
- **Representativeness.** Representativeness of the data was evaluated through the use of field and analytical duplicate samples, and laboratory and field blanks.
- **Completeness.** The analytical completeness, i.e., the percentage of obtained measurements that are judged to be valid and usable (excludes data that are qualified with R or UR).
- **Comparability.** Comparability of the data was evaluated through the use of field and analytical QC samples; through the use of consistent CRDLs and ensuring that the laboratories met them; and by management oversight, which determined that the work was performed consistently with previous techniques.

The following sections summarize the PARCC parameters and data usability for each sample event.

6.2 Data Usability

6.2.1 Spring 2013

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and Representativeness were acceptable with the field duplicates exhibited overall good reproducibility and no background contamination impacting results (see accuracy discussion below). There were several instances where poor precision was noted and the results were qualified, but there was no overall impact to data usability or potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results were acceptable. Sample MW-807-SP13 was collected twice (160-2163-28 and 160-2187-13) due to inaccurate field records. Both of the results were reported; however, only samples 160-2187-13 and its parent sample PW-07-01-SP13 (160-2187-12) were used for site characterization and QC purposes.

Accuracy was acceptable with laboratory spikes and field and laboratory blanks exhibited overall good recoveries and minimal background contamination. Laboratory control samples were generally good, with the exception of a low recovery of methylcyclohexane, which resulted in the associated results being qualified as estimated. In several of the SDGs, the continuing calibration results exceeded the percent difference from the initial calibration. The analytes associated with the failures were qualified "J" if detected or "UJ" if non-detect. Of the nine samples analyzed as MS/MSDs, there were two instances where an analyte failed QC criteria and the results were "J" qualified. Several compounds were detected in the method, rinsate and trip blanks; however, all of the blank detections were less than the QL. The results were either "J" or "UJ" qualified based on the level of contamination versus the amount present in the project sample.

Completeness of the results was acceptable as noted on Table 5.1-1. The only sample results rejected were MW-812-SP13 as noted below. The overall completeness of data was 99.99%.

Comparability of results for volatiles analysis of MW-812-SP13 are compromised due to a laboratory dilution reporting error. The results were reported as rejected.

6.2.2 Summer 2013

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and Representativeness were acceptable with the field duplicates exhibited overall good reproducibility and no background contamination impacting results (see accuracy discussion below). There were several instances where poor

precision was noted and the results were qualified, but there was no overall impact to data usability or potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results were acceptable.

Accuracy was acceptable with laboratory spikes and field and laboratory blanks exhibited overall good recoveries and minimal background contamination. Overall, the LCS recoveries were generally good. No qualifications were required for LCS recoveries that exceeded QC criteria and the associated samples were non-detect. In several of the SDGs, the continuing calibration results exceeded the percent difference from the initial calibration. The analytes associated with the failures were qualified "J" if detected or "UJ" if non-detect. Of the eight samples analyzed as MS/MSDs, there were three instances where analytes failed QC criteria and the detected results were "J" qualified. Acetone was detected in the method, rinsate and trip blanks and in addition, several other compounds were detected in two of the rinsate blanks; however, all of the blank detections were less than the QL. The results were either "J" or "UJ" qualified based on the level of contamination versus the amount present in the project sample. The tracer recovery was outside of QC limits in method A-01-R and the associated results were "J" qualified. Ferrous iron is typically a field test with a holding time of 15 minutes. The test was completed in the field; however, 15 duplicate samples were also submitted to the laboratory for analysis. The laboratory results were qualified with an "HF" to denote that the analysis was performed outside of the defined holding time.

Completeness of the results was acceptable as noted on Table 5.2-1. All of the results were acceptable and valid for an overall completeness of data of 100%.

Comparability of results was acceptable as all data was usable and valid. Approximately 10% of the ferrous iron results were analyzed in the laboratory for comparison. If the results were non-detect in the field, then they were non-detect in the laboratory; however, detectable amounts of ferrous iron from the field samples did not correlate well with the laboratory duplicate results. The laboratory results are considered quantitative despite the analysis being outside of holding time.

A Data Usability Summary Reports

This page intentionally left blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2089**
Date Completed: 6/27/013	**Data Validation Chemist: S. Elliot, J. Christopher**
Date Performed: 7/16/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No - Sample PW-04-06-SP13 (160-2089-2) was logged in at GEL as PW-04-06-2013 (160-2089-2); GEL sample ID 32404002; Sample W-12-70-SP13 (160-2089-11) was logged in at GEL as W-12-70-2013 (160-2089-11); GEL sample ID 32404011; this was corrected by the validator in the EDD only.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No – some containers received broken however sufficient sample remained for analysis. Specific samples affected were not noted.
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2089**
Date Completed: 6/27/013	**Data Validation Chemist: S. Elliot, J. Christopher**
Date Performed: 7/16/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and acetone were detected in the method blanks 160-46403/2, 160-46687/2, and 160-46896/2. 1,2,4-trichlorobenzene and acetone were detected in rinse blank RB-01-SP13 Acetone, chloroethane, and toluene were detected in trip blank TB-01-SP13
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of dibromofluoromethane and 1,2-dichloroethane-d4 was reported for sample W-12-70-SP13 (160-2089-11). No target analytes associated with dibromofluoromethane and 1,2-dichloroethane-d4 were reported and therefore, no qualification of sample results was performed. High recovery of dibromofluoromethane was reported in the MSD prepared with project sample W-17-130-SP13 (160-2089-21 MSD). All other surrogate recoveries were within QC limits. No qualification of sample results has been performed.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2089**
Date Completed: 6/27/013	**Data Validation Chemist: S. Elliot, J. Christopher**
Date Performed: 7/16/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Due to high concentrations in the native sample, recovery of tetrachloroethene is outside of QC limits for the MS/MSD prepared with project sample W-17-130-SP13 (160-2089-21). The LCS is within QC limits and no qualification of sample results has been performed.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Acetone exhibited poor precision in MW-804-SP13.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No field blanks included with this SDG.)

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2089**
Date Completed: 6/27/013	**Data Validation Chemist: S. Elliot, J. Christopher**
Date Performed: 7/16/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2089**
Date Completed: 6/27/013	**Data Validation Chemist: S. Elliot, J. Christopher**
Date Performed: 7/16/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Sample containers broken during shipping to the laboratory; however, there was sufficient sample to perform the required analyses.
Minor Concerns
VOC results qualified based on method and trip blank contamination. Transcription errors during sample login at GEL for total U analysis.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2112**
Date Completed: 6/27/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes – however, lab issued a revision to the report due to client request to change sample IDs W-30-28S-SP13 to W-30-285-SP13, W-27-28S-SP13 to W-27-285-SP13, and MW-27I-SP13 to MW-23I-SP13
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No – PW-03-07-SP13, RB-02-SP13 arrived broken; however, sufficient volume remained for analysis.
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2112**
Date Completed: 6/27/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and acetone were detected in method blanks 160-46896/2 and 160-47099/2 1,2,4-trichlorobenzene, 2-hexanone, acetone, chloroform, cyclohexane, methylene chloride, and toluene were detected in rinse blank RB02-SP13 Acetone, m&p-xylene, o-xylene, and toluene were detected in rinse blank RB03-SP13 Acetone, 2-hexanone, and toluene were detected in trip blank TB02-SP13.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of dibromofluoromethane was reported for the diluted analysis of W-27-28S-SP13 (160-2112-30 DL). No target analytes associated with dibromofluoromethane were reported and therefore, no qualification of sample results was performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – High recovery of cyclohexane, methyl acetate, methylcyclohexane was reported for the MS and high recovery of 1,1,1-trichloroethane, cyclohexane, bromodichloromethane, and methylcyclohexane was reported for the MSD prepared with project sample PW-03-02-SP13 (160-2112-20). Positive results of cyclohexane, methyl acetate, 1,1,1-trichloroethane, bromodichloromethane, and methylcyclohexane for PW-03-02-SP13 were qualified as estimated.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2112**
Date Completed: 6/27/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No - Acetone and carbon disulfide exhibited poor precision for MW-803-SP13 and MW-23S-SP13.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (Two equipment rinsate blanks included in this SDG)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2112**
Date Completed: 6/27/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	Yes - 2 field duplicates were associated with this SDG.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2112**
Date Completed: 6/27/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - Trichlorofluoromethane, 1,1,2-trichloro-1,2,2-fluoromethane, carbon tetrachloride, and 1,1,1-trichloroethane are outside of the upper QC limit for the continuing calibration with file ID ZCCV7256.D. Associated sample results are non-detects. Therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Sample containers broken during shipping to the laboratory; however, there was sufficient sample to perform the required analyses.
Minor Concerns
VOC results qualified based on method and trip blank contamination, and MS and MSD recovery. Laboratory report was revised to correct three sample IDs.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.
4 - The reported result has been qualified as estimated. The recovery of the MS or MSD is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2133**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No – analyses not marked on the COC. Lab confirmed with PM. One vial for TB-03-SP13 received with headspace.
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2133**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Acetone was detected in trip blank TB-03-SP13.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for trip blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2133**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No
Do field duplicate results show good precision for all compounds? See Table 4	No - Acetone exhibited poor precision in samples MW-806-SP13 and MW-18I-SP13.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No equipment rinsate blanks included in this SDG)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	No. The uranium concentration for the sample that was designated for MS/MSD for this SDG (MW-41S-SP13 (160-2133-1)) was more than 4X the spike amount, and required a 50X dilution for analysis; therefore, no results were qualified on this basis.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2133**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 4	No – 2 field duplicate sample pairs were associated with this SDG. Uranium in one duplicate pair was qualified due to poor precision.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to confirm quenching; two samples were diluted due to high uranium concentrations; only one result was reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2133**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
One sample received by laboratory for VOC analysis with headspace. Requested analyses not logged on COC (corrected and confirmed with PM).
Minor Concerns
VOC results qualified based on trip blank contamination. Total U: MS/MSD recoveries outside criteria due to uranium concentration in parent sample > 4X spike concentration; precision for one field duplicate sample pair outside criteria.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2163**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. GEL received sample 160-2163-F-20; however this sample was not listed on the COC; email included in the data package confirms that analysis for this sample was canceled and the location would be resampled; the sample was not analyzed. Analyses not marked on page 4 of the COCs. Lab confirmed with PM correct analysis. Sample ID's did not match (specific samples not noted). Lab logged per COC with slight modification per the PM.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2163**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip, and field blanks? See Table 3	Yes – Acetone, chloroethane, and toluene were detected in trip blank TB-04-SP13 (160-2163-38). Acetone was detected in the method blank 160-47749/1
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 4-bromofluorobenzene was reported in the diluted analysis of samples MW-24S-SP13 DL (160-2163-8), PW-02-07-SP13 DL (160-2163-17), MW-809-SP13 DL (160-2163-29), and MW-208-350-SP13 DL (160-2163-30). High recovery of dibromofluoromethane, 1,2-dichloroethane-d4, toluene-d8, and 4-bromofluorobenzene was reported in sample MW-20D-SP13 (160-2163-37). High recovery of dibromofluoromethane, 1,2-dichloroethane-d4, and toluene-d8 was reported in sample TB-04-SP13 (160-2163-38) No target analytes associated with the above surrogate compounds were detected above the reporting limit; therefore, no qualification of sample results was performed.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2163**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Insufficient sample volume was available to perform MS/MSD analysis for the VOCs and therefore, MS/MSD performance could not be evaluated.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - High recovery of cyclohexane and methylcyclohexane are outside of the upper QC limit for the LCS with lab ID 160-47751/3. Cyclohexane and methylcyclohexane were not detected in associated project samples. No qualification of sample results has been performed.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No - 2-hexanone exhibited poor precision for MW-808-SP13 and MW-28I-SP13 and Acetone exhibited poor precision for MW-809-SP13 and MW-208-350-SP13.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No equipment rinsate blanks included in this SDG)

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2163**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	No - Field duplicate samples MW-809-SP13 (160-2163-29) and MW-808-SP13 (160-2163-32) may have been switched in transfer to subcontractor laboratory (see Table 4). If samples were switched there would be good precision for both field duplicate sample pairs.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; one sample was diluted due to high uranium concentration; only one result was reported per sample.

	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - 2-hexanone is outside of the lower QC limit for the continuing calibration with file ID LCCV0073.D. Associated sample results have been qualified as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2163**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Summary of Potential Impacts on Data Usability
Major Concerns
Two of three field duplicate sample pairs appear to have been switched for Total U analysis; results qualified due to poor precision (precision would have been good for both pairs if sample pairs were switched).
Minor Concerns
VOC results qualified based on method and trip blank contamination, and continuing calibration recovery.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The percent difference (%D) between the relative response factor of the initial calibration and the continuin calibration is outside of QC limits.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2187**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Cooler temperature not noted in case narrative or in the Login Sample Receipt Checklist. One vial broken for MW-810-SP13, MW-206-470-SP13, MW-205-470-SP13; Two vials broken for MW-49S-SP13. COC not relinquished (signed).
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2187**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in method blanks 160-47958/2 and 160-48625/2 1,4-dioxane, acetone, chloroform, and toluene were detected in rinse blank RB-04-SP13 Acetone was detected in trip blank TB-05-SP13.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 4-bromofluorobenzene was reported in samples MW-810-SP13 (160-2187-16) and MW-805-SP13 (160-2187-25). No associated target analytes were detected; therefore, no qualification of sample results was performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – High recovery of cyclohexane was reported in the MS/MSD pair prepared with project sample W-37-385-SP13 (160-2187-21). Cyclohexane was not detected in associated project samples and no qualification of sample results has been performed. Low recovery of methyl acetate was reported for the MS/MSD pair prepared with project sample MWP-114-290-SP13 (160-2187-30). Results of methyl acetate for the associated project sample have been qualified as estimated.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2187**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - High recovery of cyclohexane was reported for the LCS with lab ID 160-48078/4. Cyclohexane was not detected in the associated samples; therefore, no qualification of sample results has been performed.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No - Multiple analytes exhibited poor precision across several duplicate pairs. Refer to Table 4.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (One equipment rinsate blank included in this SDG)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2187**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/22/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	Yes - 4 field duplicates were associated with this SDG.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to confirm quenching; only one result was reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - 1,2,3-trichlorobenzne is outside of the upper QC limit for the CC with lab file ID ZCCV7357.D. Associated sample results have been qualified as estimated if detectable.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	LAB SDG ID: 160-2187
Date Completed: 6/28/2013	Data Validation Chemist: S. Elliott, J. Christopher
Date Performed: 7/22/2013	Data Validation Review: J. Nelson

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Sample containers broken during shipping to the laboratory; however, there was sufficient sample to perform the required analyses; cooler temperature upon receipt not noted on COC.
Minor Concerns
VOC results qualified based on method, rinse, and trip blank contamination, and MS and MSD recovery. COC not signed for relinquishing samples.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable

LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.
4 - The reported result has been qualified as estimated. The percent recovery (%R) of the associated matrix spike (MS) and/or matrix spike duplicate (MSD) is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2198**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2198**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in method blank 160-48625/2 Acetone, tetrachloroethene, and toluene were detected in rinse blank RB-05-SP13 Acetone and tetrachloroethene were detected in trip blank TB-06-SP13
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 4-bromofluorobenzene was reported in samples MW-203-160-SP13 (160-2198-8) and MWP-110-355-SP13 (160-2198-11). No target analytes associated with 4-bromofluorobenzene were reported and therefore, no qualification of sample results was performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No – Low recovery of methyl acetate was reported for the MS/MSD pair prepared with sample 160-2187-30. This MS/MSD is not associated with samples collected as part of this SDG and therefore no qualification of sample results has been performed.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2198**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - Low recovery of methylcyclohexane was reported for the LCS and LCSD with lab ID 160-49272/4. Associated project results have been qualified as estimated.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No - Several analytes exhibited poor precision across multiple duplicate pairs. Refer to Table 4.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (One equipment rinsate blank included in this SDG)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2198**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result was reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2198**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - Acetone, methyl acetate, methyl tert-butyl ether, 2-butanone, 4-methyl-2-pentanone, 2-hexanone, and 1,1,2,2-tetrachloroethane are outside of the lower QC limit for the continuing calibration with file ID MCCV6488.D. Associated sample results have been qualified as estimated.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
VOC results qualified based on method, rinse, and trip blank contamination, and continuing calibration criteria.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry

ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.
4 - The reported result has been qualified as estimated. The percent recovery (%R) is outside of QC limits for the associated laboratory control sample.
5 - The reported result has been qualified as estimated. The percent difference (%D) between the initial calibration relative response factor (RRF) and the continuing calibration RRF is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2215**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No - One empty vial received for MW-12-SP13 and MW-30I-SP13
Frequency of Field QC Samples Correct?	Yes
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/SE/JC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2215**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and acetone were detected in method blank 160-49042/2 Acetone was detected in trip blanks TB-07-SP13 and TB-08-SP13.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples across multiple batches were qualified for method blank contamination. Rinsate and trip blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 1,2-dichloroethane-d4 was reported in sample MW-30S-SP13 (160-2215-17). No target analytes associated with 1,2-dichloroethane were reported and therefore, no qualification of sample results was performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	Yes
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2215**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No - Multiple analytes exhibited poor precision across both duplicate pairs. Refer to Table 4.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	No. (No equipment rinsate blanks included in this SDG)
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2215**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 4	No - Two field duplicate sample pairs were associated with this SDG. Uranium in one duplicate pair was qualified due to poor precision.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to confirm quenching; only one result was reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - Dichlorodifluoromethane is outside of the upper QC limit for the CCs with file IDs ZICV7488.D and ZCCV7500.D. Associated sample results are non-detects. Therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Spring 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-2215**
Date Completed: 6/28/2013	**Data Validation Chemist: S. Elliott, J. Christopher**
Date Performed: 7/23/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
VOC results qualified based on method and rinse blank contamination. Total U: Precision for one field duplicate sample pair outside criteria.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3377**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data. The date for sample W-12-70-SU13 was incorrectly entered on the COC as 8/14/13 (and subsequently in the hard copy report and the EDD). The date was corrected to 8/13/13 by the validator in the EDD and DUSR.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair was included with this SDG
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3377**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone and m&p-xylene were detected in trip blank TB01-SU13
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for trip blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3377**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Chloromethane and styrene exhibited poor precisions in field duplicate MW-603-SU13; however, results of chloromethane and styrene were below the reporting limit. No qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 3	Yes - Total U: Uranium was detected in equipment rinsate blank sample RB-01-SU13 (160-3414-18); GEL ID 331916014 at 0.297 µg/L concentration. One associated sample result (W-03-72-SU13 [160-3377-2]) was U qualified for rinsate blank contamination.
Were all samples run under acceptable calibration?	Yes
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3377**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	N/A – No isotopic U alpha spec analyses were performed for this SDG.
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3377**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for chloromethane, vinyl chloride, and bromomethane is outside of the upper QC limit for the CC with file ID MCCV7724.D. Samples were results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
None
Minor Concerns
VOC results qualified based on trip blank contamination. Total U: Date correction for one sample; uranium detected in equipment rinsate blank causing one result to be U-qualified.

Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data. Five samples in this SDG were analyzed for isotopic uranium by alpha spectroscopy.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - Four field duplicate sample pairs were included with this SDG. See Table 4.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3398**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone and tetrachloroethene were detected in trip blank TB02-SU13 Low levels of acetone and carbon disulfide were detected in trip blank TB03-SU13 Low levels of acetone and styrene were detected in the method blank with file ID MBLK7753.D Low levels of acetone were detected in the method blank with file ID ZBLK9810.D
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank and trip blank contamination. Rinsate blanks qualified multiple analytes in multiple samples.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3398**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Poor performance was noted for several VOCs in duplicate samples MW-600-SU13, MW-601-SU13, and MW-604-SU13 and their native pairs; however the VOCs were detected below the reporting limit; therefore, no qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration are outside of QC limits.
Minor Concerns
VOC results qualified based on trip blank and method blank contamination. Total U: Uranium detected in equipment rinsate blank but no sample results for this SDG were U-qualified

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No - Sample 160-3414-1 was incorrectly logged in as W-31-95-SU14. The correct field sample ID is W-31-95-SU13 as per the COC and has been corrected in the GEL EDD and the DUSR. The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair and one equipment rinsate blank were included with this SDG. See Table 4
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone and 1,2-dichlorobenzene were detected in trip blank TB04-SU13 Low levels of acetone and trichloroethene were detected in trip blank TB05-SU13 Acetone and low levels of chloromethane, cis-1,2-dichloroethene, tetrachloroethene, and toluene were detected in rinse blank RB-01-SU13 Low levels of acetone were detected in the method blank with file ID MBLK7859.D Low levels of acetone were detected in the method blank with file ID ZBLK9810.D Low levels of acetone were detected in the method blank with file ID ZBLK0052.D
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank, rinse blank, and trip blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of toluene-d8 was reported in sample 160-3414-3 (W-16-148-SU13). The sample was reanalyzed and the surrogate was within QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No - High recovery of cyclohexane was reported in the MS prepared with 160-3414-1 (W-31-95-SU13). The RPD values of 2-butanone, acetone, and methyl acetate are outside of QC limits.
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - Bromomethane and chloromethane are outside of the upper QC limit for the LCS with file ID MLCS7856.D.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Poor performance was noted for several VOCs in duplicate samples MW-606-SU13 and MW-611-SU13 and their native pairs; however the VOCs were detected below the reporting limit; therefore, no qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	Yes - Total U: Uranium was detected in equipment rinsate blank sample RB-01-SU13 (160-3414-18); GEL ID 331916014 at 0.297 µg/L concentration. Two associated sample results (W-16-148-SU13 [160-3414-3] and W-17-130-SU13 [160-3414-9]) were U-qualified for rinsate blank contamination.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	Yes
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	No. Isotopic Uranium: U-232 tracer yields for two samples were below criteria. The sample results were qualified with J as estimated.
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for chloromethane, vinyl chloride, and bromomethane is outside of the upper QC limit for the CC with file ID MCCV7855.D. Sample results were non-detect; therefore, no qualification of sample results has been performed. The %D for dichlorodifluoromethane and isopropylbenzene is outside of the upper QC limit for the CC with file ID ZCCV9754.D. Sample results were non-detect; therefore, no qualification of sample results has been performed. The %D for 1,2,3-trichlorobenzene is outside of the upper QC limit for the CC with file ID ZCCV9934.D. Sample results were non-detect; therefore, no qualification of samples results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3414**
Date Completed: 11/26/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs.
Minor Concerns
VOC results qualified based on trip blank, rinse blank, and method blank contamination. Total U: Uranium detected in equipment rinsate blank causing two sample results to be U-qualified. Isotopic U: Tracer yields below criteria causing results for two samples to be J-qualified.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The relative percent difference (RPD) between the matrix spike and the matrix spike duplicate is outside of QC limits.
3 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated trip or rinsate blank.
4 - The reported result has been qualified as estimated. The tracer recovery is outside QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No - Sample MW-29S-SU13 (160-3429-21) was logged for total U analysis on the COC for TA; however, it was not sent to GEL until more than a month after the rest of the samples were sent. The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair was included with this SDG.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone and methylene chloride were detected in trip blank TB06 Low levels of acetone and methylene chloride were detected in trip blank TB07 Low levels of acetone were detected in the method blank with file ID ZBLK9988.D
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 1,2-dichloroethane-d4 was reported in sample 160-3429-19 (MW-51I-SU13). No target analytes associated with the surrogate compound were detected; therefore, no qualification of sample results has been performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No - The RPD of 1,2,3-trichlorobenzene is outside of QC limits for the MS/MSD prepared with project sample 160-3429-8 (MW-15S-SU13).

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Poor performance was noted for several VOCs in duplicate samples MW-607-SU13 and MW-612-SU13 and their native pairs; however the VOCs were detected below the reporting limit; therefore, no qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	N/A
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No - Chlorobenzene-d5 is outside of the upper QC limit for 160-3429-7, -9, -11, -14, and -16. No target analytes associated with this internal standard were detected; therefore, no qualification of samples results has been performed. 1,4-dichlorobenzene-d4 is outside of the lower QC limit for 160-3429-2, -3, -4, -5, -6, -7, -9, -11, -12, -13, -14, and -16. No target analytes associated with this internal standard were detected; therefore, no qualification of sample results has been performed.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for 1,2,3-trichlorobenzene is outside of the upper QC limit for the CC with file ID MCCV9934.D. Sample results were non-detect; therefore, no qualification of sample results has been performed. The %D for vinyl chloride and acetone is outside of the upper QC limit for the CC with file ID ZCCV9984.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3429**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Internal standards were outside of QC limits for several samples.
Minor Concerns
VOC results qualified based on trip blank, rinse blank, and method blank contamination. Total U: One sample was sent to GEL from TestAmerica more than a month later than the rest of the samples.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

TB-06	160-3429-22	Acetone	0.998	1.9	J	1.9	UJ	Qualify	1
TB-07	160-3429-23	Acetone	0.998	1.8	J	1.8	UJ	Qualify	1

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank
3 - The reported result has been qualified as estimated. The relative percent difference (RPD) between the matrix spike and the matrix spike duplicate is outside of QC limits.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3441**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair was included with this SDG
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3441**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone and methylene chloride were detected in trip blank TB09
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for rinse blank and trip blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs*. *Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3441**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Poor performance of acetone was noted in duplicate sample MW-608-SU13 and its native pair; however, acetone was detected below the reporting limit and therefore, no qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3441**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment **Note: This is a chemical analysis method using phosphorescence detection.**	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	Yes
Do field duplicate results show good precision? See Table 4	No - Total U: The results for the field duplicate sample pair were qualified with J.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No - 1,4-dichlorobenzene-d4 is outside of the lower QC limit for 160-3441-1, -2, -6, and -14. No target analytes associated with this internal standard were detected; therefore, no qualification of samples results has been performed.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3441**
Date Completed: 11/27/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/2013	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for dichlorodifluoromethane, chloromethane, and vinyl chloride is outside of the upper QC limit for the CC with file ID ZCCV9899.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Internal standards were outside of QC limits for several samples.
Minor Concerns
VOC results qualified based on trip blank and rinse blank contamination. Total U: Poor precision for field duplicate sample pair causing those results to be J-qualified.

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair was included with this SDG. See Table 4.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in trip blanks TB10-SU13 and SB11-SU13. Low levels of acetone were detected in the method blank with file ID ZBLK9988.D. Low levels of acetone were detected in the method blank with file ID ZBLK0020.D.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No - Methyl acetate is outside of the upper QC limit for the MS prepared with project sample 160-3464-1 (MW-212-580-SU13). No target analytes associated with the surrogate compound were detected; therefore, no qualification of sample results has been performed.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for vinyl chloride is outside of the upper QC limit for the CC with file ID ZCCV9984.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Surrogate recovery is outside of QC limits for one project sample.
Minor Concerns
VOC results qualified based on method blank, trip blank, and rinse blank contamination.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3532**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate sample pair was included with this SDG. See Table 4.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3532**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in trip blanks TB12-SU13 and TB13-SU13. Low levels of acetone were detected in the method blank with file ID ZBLK0052.D. Low levels of acetone were detected in the method blank with file ID ZBLK0186.D. Low levels of acetone were detected in the method blank with file ID ZBLK0253.D.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank, rinse blank, and trip blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No - High recovery of 1,2-dichloroethane-d4 was reported in samples 160-3532-10 (MW-210-470-SU13) and -11 (MW-210-280-SU13). Samples were reanalyzed and surrogate recoveries are within QC limits. No qualification of samples results has been performed.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3532**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	No – Poor performance of acetone was noted in duplicate sample MW-613-SU13 and its native pair; however, acetone was qualified below the reporting limit and therefore, no qualification of sample results has been performed.

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3532**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	N/A
Do field duplicate results show good precision? See Table 4	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3532**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for styrene is outside of the upper QC limit for the CC with file ID ZCCV0048.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Several surrogate recoveries are outside of QC limits.
Minor Concerns
VOC results qualified based on method blank, trip blank, and rinse blank contamination.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - Sample MW-205-285-SU13 was logged by TestAmerica on the COC to GEL as MW-20-285-SU13 and the incorrect sample ID was used in the data package and the EDD. The sample ID has been corrected in the DUSR and EDD. The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - No field duplicates were included with this SDG.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3543**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in trip blank TB14-SU13. Low levels of acetone, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene were detected in the method blank with file ID ZBLK0218.D. Low levels of acetone were detected in the method blank with file ID ZBLK0186.D. Low levels of acetone were detected in the method blank with file ID ZBLK0342.D.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3543**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes.
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3543**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment **Note: This is a chemical analysis method using phosphorescence detection.**	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	N/A
Do field duplicate results show good precision? See Table 4	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3543**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for carbon tetrachloride, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene is outside of the upper QC limit for the CC with file ID ZCCV0214.D. Sample results were non-detect; therefore, no qualification of sample results has been performed. The %D for methyl acetate, 2-butanone, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene is outside of the upper QC limit for the CC with file ID ZCCV0336.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs.
Minor Concerns
VOC results qualified based on method blank, trip blank, and rinse blank contamination. Total U: Sample ID transcription error on COC to GEL and in GEL data package.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3563**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - Sample W-12-120-SU13 was logged by TestAmerica on the COC to GEL as MW-12-120-SU13; sample W-02-70-SU13 was logged by TestAmerica on the COC to GEL as MW-2-70-SU13; and sample MW-204-470-SU13 was logged by TestAmerica on the COC to GEL as MW-P204-470-SU13. The incorrect sample IDs were used in the data package and the EDD. The sample IDs have been corrected in the DUSR and EDD. The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - No field duplicates were included with this SDG.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3563**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	Yes - Ferrous iron analysis is typically performed in the field and has a method recommended holding time of 15 minutes. All ferrous iron results have been qualified as "HF" to denote that samples were analyzed outside of the method recommended holding time.
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in trip blank TB15-SU13. Low levels of acetone were detected in the method blank with file ID ZBLK0342.D.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3563**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - High recovery of 1,2,3-trichlorobenzene was reported in the LCS and LCSD with filed ID ZLCS30367.D. Associated sample results were non-detect; therefore, no qualification of sample results has been performed
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	N/A

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes

ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Several LCS recoveries are outside of QC limits.
Minor Concerns
VOC results qualified based on method blank, trip blank, and rinse blank contamination. Total U: Sample ID transcription errors on COC to GEL and in GEL data package.

Notes:
1 - The reported result has been negated. The amount detected in the sample is less than 5x the amount detected in the associated method blank.
2 - The reported result has been qualified as estimated. The amount detected in the sample is greater than 5x but less than 10x the amount detected in the associated method blank

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3575**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes - The total uranium analysis was subcontracted to GEL Laboratories and both laboratory sample IDs are referenced for those data.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes
Frequency of Field QC Samples Correct?	Yes - One field duplicate was included with this SDG.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes
All forms and raw data complete?	Yes
Case narrative present and complete?	Yes
Target analyte list and reporting limits match QAPP?	Yes

Initials – completed above JN/JZC

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3575**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method, trip and field blanks? See Table 3	Yes – Low levels of acetone were detected in trip blank TB15-SU13. Low levels of acetone were detected in the method blank with file ID ZBLK0342.D.
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes – Several samples were qualified for method blank, rinse blank, and trip blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	N/A
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	N/A
LCS within QC criteria? See Table 3 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No - High recovery of 1,2,3-trichlorobenzene was reported in the LCS and LCSD with filed ID ZLCS30367.D. Associated sample results were non-detect; therefore, no qualification of sample results has been performed

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3575**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Chemical Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes – Samples were reanalyzed due to analytical issues, only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 4	Yes

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Were all samples run under acceptable calibration?	Yes
Any compounds present in method and field blanks? See Table 3	No
Were any analytes flagged for blank contamination? See Table 3 *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No
LCS within QC criteria (75-125% recovery)? See Table 3 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3575**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review Total U Analysis - Approval by Data Validation Chemist - See Attachment Note: This is a chemical analysis method using phosphorescence detection.	
Description	**Notes and Qualifiers**
Tracer yields within QC criteria for Alpha Spec (30-110% recovery)? See Table 3	Yes
Do field duplicate results show good precision? See Table 4	No.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes - Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	**LAB SDG ID: 160-3575**
Date Completed: 12/2/13	**Data Validation Chemist: J. Z. Christopher**
Date Performed: 12/5/13	**Data Validation Review: J. Nelson**

Compliance Review by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No - The %D for dichlorodifluoromethane, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene is outside of the upper QC limit for the CC with file ID ZCCV0366.D. Sample results were non-detect; therefore, no qualification of sample results has been performed. The %D for methyl acetate, 2-butanone, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene is outside of the upper QC limit for the CC with file ID ZCCV0336.D. Sample results were non-detect; therefore, no qualification of sample results has been performed.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	Yes
GC/MS	For TICs are there any system related compounds that should not be reported?	NA
ICP	ICS recoveries within 80-120%?	Yes
ICP	ICV recoveries within 90-110%?	Yes
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes
ICP	CRI recoveries within 20% of expected value?	Yes
ICP	ICB/CCB detections <2X MDL?	Yes
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes

Summary of Potential Impacts on Data Usability
Major Concerns
Several compounds in the continuing calibration were outside of QC limits for VOCs. Several LCS recoveries are outside of QC limits.
Minor Concerns
VOC results qualified based on method blank, trip blank, and rinse blank contamination.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater Characterization – Summer 2013
Laboratory: TestAmerica	LAB SDG ID: 160-3575
Date Completed: 12/2/13	Data Validation Chemist: J. Z. Christopher
Date Performed: 12/5/13	Data Validation Review: J. Nelson

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Introduction

The Louis Berger Group, Inc. (LBG), and their subcontractor, Ecology and Environment (E & E), have been contracted by the United States Army Corps of Engineers (USACE), under Contract Numbers W912DQ-08-D-0017, Task Order No. 0019 and W912DQ-11-D-3009, Task Order No. 0012, to perform an Off-Site Groundwater Characterization and Feasibility Study (FS) at the Sylvania Corning Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Sylvania Site or the Site) located in Hicksville, Nassau County, New York.

The study objectives are to:

- Characterize the nature and extent of off-site groundwater contamination originating from the Sylvania Site.
- Determine if groundwater contaminants from the Sylvania Site are reaching and moving beyond the municipal water supply wells at the Hicksville Water District Plant 5 and Bowling Green facilities.
- Collect sufficient data to select remedial alternatives and prepare a FS for remediation of the Site.

This quality control summary report (QCSR) presents the results of the sampling and analytical program and provides an opportunity to review the completeness and quality of the data collected.

The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling investigation conducted at each site (see Section 1);
- Identify any deviations from the proposed sampling and analysis procedures (see Sections 1 and 2);
- Present the analytical results for the field samples collected (see Section 3);
- Report on any inspections or audits performed and any findings that that may impact the project data (see Section 4); and
- Discuss the results of the data quality evaluation associated with the sampling events (see Sections 2 and 5).

- Discuss the precision, accuracy, completeness, and comparability of the data (see Section 6).

Evaluation of any contaminants detected will be provided in the RI Report. The RI Report also will contain maps of sample locations and summary tables of positive results.

Supporting information is included in appendices to the QCSR. The appendices are located on the attached DVD and include:

- Appendix A – Data Review Memoranda (DRM) and Data Usability Summary Report (DUSR) – The DRM or DUSR prepared for each sample delivery group (SDG) in PDF format; verification of CSIA Data; section of Evaluation Memorandum Sylvania-Corning FUSRAP Site Compound Specific Isotope Analysis (CSIA).
- Appendix B – Analytical Data – All laboratory reports on compact disk in PDF format, which include case narratives and quality control (QC) sample results.
- Appendix C – Sample Collection Documentation – Documentation of field audits performed by LBG.

1 Data Collection

Environmental samples were collected as part of the field characterization in accordance with the final Work Plan (WP), Health and Safety Plan, and Quality Assurance Project Plan (QAPP), Off-Site Groundwater Characterization and Feasibility Study for the Sylvania Corning FUSRAP Site (LBG 2011a), as amended by the Work Plan Amendment Memorandum (LBG 2013), Work Plan Amendment #2 (LBG 2014), and Work Plan Amendment #3 (LBG 2015). Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; containerization of investigation-derived waste (IDW); and site surveying were performed in accordance with the WP, QAPP, and documents referenced therein. All field QC activities were carried out in accordance with the final Quality Control Plan (QCP) (LBG 2011b). Field data collection activities for each phase are summarized below. Audits were performed for each phase as described in Section 4.

Quality assurance/quality control (QA/QC) samples were collected on a site-wide basis according to the criteria established in the QAPP. The field QA/QC sample requirements are as follows:

- Field QC duplicates collected at a frequency of 10% of the number of field samples collected;
- Rinsates collected at a frequency of 10% of the number of field samples collected if non-dedicated equipment was used;
- Matrix spike/matrix spike duplicate (MS/MSDs) for laboratory QC collected at a frequency of 5% of the samples collected; and
- Trip blanks sent one per shipment for each cooler in which water samples for volatile organic compound (VOC) analysis were shipped. Trip blanks were analyzed for all VOC methods designated for the samples.

Any minor variances in field methodologies that occurred during the characterization are noted on the daily activity summary reports or in the field logbook. Deviations from the WP were noted on field adjustment forms. Copies of these reports and forms are provided in Appendix C. The following sections summarize the deviations and fieldwork activities for each phase of fieldwork.

1.1 Off-Site Groundwater Characterization Data Collection – Phase IVb and IVc

This section of the QCSR summarizes the sampling results for Off-Site Groundwater Characterization – Phase IV, which included vertical profile groundwater screening and sampling (borings MW-215 through MW-225; MW-58 and MW-59), monitoring well installation (MW-215 through MW-225; MW-58-75 and MW-59-75), well development, and monitoring well sampling events (Winter 2015, Spring 2015 and Spring 2016). The investigation activities were conducted between December 2013 and April 2016.

1.1.1 Drilling and Vertical Profile Sampling

The drilling and vertical profile sampling procedures were performed in accordance with the final Work Plan (LBG 2011a), Work Plan Amendment #2 (LBG 2014), and Work Plan Amendment #3 (LBG 2015). Summaries of exceptions to the WP and amendments are described below:

- The WP stated that the last five samples collected from the planned end of each boring were to be submitted for quick turnaround analysis (12 hour). In some cases, six samples were submitted for quick turnaround analysis to ensure that an entire data set was available so that monitoring well screen placement decisions could be made as quickly as possible after the last sample had been collected.
- Drill water samples were collected per newly mobilized drill rig in addition to a monthly sample to identify any potential cross contamination from drilling equipment. The drill water source (public water supply) did not change over the course of the investigations.
- Boreholes were cleared using post-hole diggers and hand augers as opposed to air knife techniques described in the WP. Since access to all locations was not available at the onset of the investigation, this method was most efficient.
- In cases where a groundwater profile sample could not be collected because of geologic restrictions or equipment failures, a second sample attempt was made as close to that depth as reasonably possible. This was not always within the 10 foot interval stated in the work plan.

1.1.2 Monitoring Well Development

The monitoring well development procedures were performed in accordance with the final Work Plan (LBG 2011a,). Summaries of the exceptions are described below:

- The WP states that a picture of the development water in a clear glass jar should be taken after the completion of development from each monitoring well. This step was inadvertently overlooked in many cases. However, turbidity readings were collected at each location and all had turbidities less than 50 NTUs and were clear at the completion of development. No staining was noted from any of the newly installed monitoring wells.

- The work plan states that a minimum of three times the drill water lost to the formation during drilling in the interval 15-feet above and below the center point of the chosen screen interval. The minimum volume of water removed during development was three times the volume of water lost in a 20-foot interval centered on the well screen depth. This maintained consistency with previous well development practices completed at the site.

Monitoring well MW-216-510 did not produce water well enough to purge the drill water that was lost to the formation. It was presumed that the drill water must have been lost to the formation in more transmissive layers that the well does not draw from. Therefore, the drill water lost to the formation during drilling of the borehole at this interval was not included in the total minimum amount required for removal.

1.1.3 Monitoring Well Installation

The monitoring well sampling procedures were performed in accordance with the final Work Plan. Summaries of the exceptions to this are described below:

- The WP states that if a boring was drilled more than three feet past the well screen depth, the boring should be backfilled with clean sand. In order to protect against a potential hydraulic connection with higher conductivity sands placed below the well screen than the surrounding formation, a 2-foot fine sand seal (Moorie #00 or equivalent) was used at the top of the backfilled material.
- In some instances, bentonite chips were used as backfill at determined depths in order to preserve the integrity of massive clay layers observed beyond the intended well screen depth and prevent unintended hydraulic connectivity.

1.1.4 Groundwater Sampling

The groundwater sampling procedures were performed in accordance with the final Work Plan (LBG 2011a), Work Plan Amendment (LBG 2013), Work Plan Amendment #2 (LBG 2014), and Work Plan Amendment #3 (LBG 2015). Summaries of the exceptions to this are described below:

- Multiport monitoring well PW-5 was scheduled for sampling. However, water levels within the sample ports were nearly dry and depths to water were not indicative of aquifer conditions. The USACE team decided this well was not appropriate to sample as it did not appear to be operating properly.
- General Instruments (GI) monitoring well W-18-150 was not planned for sampling as it had been known to have an obstruction in the well that did not allow GTEOSI or GI to sample the wells. The USACE team was able to install a well wizard pump with drop tubing to collect a sample from the well screen with low flow techniques.
- Monitoring well W-10-120 had an obstruction in the well and no sampling equipment could be installed to reach the well screen to allow for low flow sampling. Therefore, this well was sampled after a minimum of three well

volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

- The U. S. Environmental Protection Agency (EPA) Region 2 low flow sampling techniques do not require any minimum purge volume. Given the depth of the monitoring wells and amount of sample tubing required to reach the monitoring well screen depth (up to 570 feet BGS), the volumes of "stagnant" water contained within sampling devices can be several gallons. Given the purge rates of low flow sampling (less than 500 mL/min) it is conceivable that sample parameters could show stabilization and the well could be sampled prior to evacuating all "stagnant" water contained within the pumping device. This could provide a sample that is not representative of aquifer conditions. After review of USACE Kansas City District (USACE KC) low flow techniques, the USACE team decided to require that a minimum of two volumes of water contained within the pumping device be removed prior to determining stabilization of parameters for sampling to ensure representative samples are collected.
- The multiport Anchor Chemical wells have seven small ports in an approximate two-inch well. When a pump is installed to purge the well, there is not room to install a water level meter to monitor the water level conditions during purging as required if using low flow sampling techniques. Therefore, this well was sampled after a minimum of three well volumes were removed and groundwater quality parameters had stabilized to ensure that all stagnant water with the well column had been purged prior to sampling.

1.2 Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge Sampling

The sampling procedures were performed in accordance with the Work Plan Amendment (LBG 2013).

1.3 CSIA Sampling

The sampling procedures were performed in accordance with the final Work Plan and Work Plan Amendment (LBG 2013).

1.4 Building 70 Waste Drain Investigation Sampling

The sampling procedures were performed in accordance with the Work Plan Amendment (LBG 2013).

1.5 Septic Tank Sampling

The sampling procedures were performed in accordance with the Work Plan Amendment (LBG 2013).

1.6 Sample Handling and Sample Custody

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in the WP. There were no devia-

tions from the WP with regards to sample handling or custody except for the following:

- The WP states that groundwater profile samples should be packaged and shipped for same day delivery. Although the majority of groundwater profile samples were delivered to the laboratory on the same day as collection, generally, samples collected after a 4 p.m. courier pick up were held on ice for delivery the following day. For aliquots requiring total uranium analysis, this was not possible as the laboratory contracted for the analysis is located in Charleston, SC. As a result of the long hold times allowable with this analysis, aliquots were collected and stored until the boring was complete before being shipped to the laboratory.
- The WP states that stainless steel containers were to be used to temporarily store aliquots for radiological analysis prior to field filtering groundwater profile samples. Stainless steel containers are not a requirement of the total uranium analytical SOP ASTM D5174 Kinetic Phosphorescence Analysis (KPA) as had been the requirement of previously used radiological analytical procedures at this site. High density polyethylene containers were used prior to filtering.
- The WP states that all samples were to be stored on ice at temperatures between 2 and 4 degrees Celsius. The total uranium analysis SOP does not require icing of samples; therefore, those samples were not placed or stored on ice.
- In Table 3.2-2 of the WP, the analytical method EPA 200.8 is referred to as the selected method for total uranium analysis. It was decided by the USACE team to use ASTM D5174 (KPA) after the submission of the Final Work Plan.
- The QAPP states that all samples were to be collected into pre-preserved containers or preserved immediately after collection. During previous field investigations at this site, it was found that the turbid samples collected during groundwater profiling only reacted with acids used to preserve the samples causing the sample to bubble. This is problematic during collection of samples for VOCs because it is difficult to collect a zero headspace sample during a reaction. For samples collected for nickel analysis, filtration of the sample to reduce turbidity was performed at the laboratory. The samples were preserved after filtration. Samples collected for total uranium analysis were collected into unpreserved containers and field filtered into pre-preserved containers at the end of each day.

1.7 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in LBG's QAPP. There were no deviations from the QAPP with regard to equipment calibration and maintenance.

1.8 Laboratory Analysis

Samples were shipped to approved laboratories for analysis. Analytical methods in support of the Off-Site Groundwater Characterization activities are referenced in the QAPP. American Analytical Laboratories (AAL) of Farmingdale, New York, provided VOC analyses for all vertical profile samples except from samples collected from borings MW-58 and MW-59 which were performed by Test America of Earth City, Missouri (Test America) and analyzed for , provided VOCs, mercury, and Target Analyte List (TAL) metals.

GEL Laboratories of Charleston, South Carolina provided total uranium analysis of vertical profile samples and monitoring well samples using the KPA method.

Test America performed analysis of nearly all monitoring well sample and soils/solids analyses including VOCs, metals mercury, and isotopic analysis by alpha spectroscopy (thorium and uranium).

Test America subcontracted the CSIA tetrachloroethylene (PCE) and trichloroethylene (TCE) analyses to ZymaX Forensic Isotope of Escondido, California, and the CSIA PCE analyses to Microseeps, Inc. of Pittsburgh, Pennsylvania. Table 1-1 lists all of the analyses performed and the number of samples collected for methods for the investigation. Any deviations were evaluated as part of the data review process and are described in Section 2.

Table 1-1 Summary of Analytical Methods and Samples, Sylvania Corning FUSRAP Site

2 Data Analysis and Validation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, chain-of-custody documents, statements in the laboratory case narratives, and field notebooks. Laboratory activities were conducted in accordance with the QAPP. The target compounds, practical quantitation limits (PQLs), and QC limits for the project were reviewed in accordance with the QAPP. Field duplicate and blank data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods. The final validated data was stored in an Environmental Quality Information Systems (EQuIS) format database.

LBG/E & E performed data review and validation of samples in accordance with the QAPP. The data review tasks completed for this project include:

- **Completeness.** LBG/E & E performed a completeness check on all EDDs and compared the data to the hard copy deliverable to verify the data were reported consistently.
- **Compliance.** LBG/E & E reviewed the laboratory reports and submitted electronic data deliverables (EDDs), checked the hard copy reports and case narratives, and verified that the submitted EDD data matched the hard copy data packages. E & E reviewed calibration information and compound identification results in the raw data package and entered the qualifiers.
- **Reporting.** E & E assigned data qualifiers and flagged all reportable data with review from LBG. Results of the data review are summarized in the DRM and DUSR in Appendix A. The DRM and DUSR contain a summary of the data that was qualified, and tables of the QC samples that did not meet applicable limits.
- **Data Management.** E & E developed a project-specific database with all validated data stored in EQuIS format. E & E developed reporting tables through the use of the EQuIS database. E & E generated summary tables of final qualified data in Excel spreadsheets as shown in Section 3.

QC samples were collected to assess the quality of the field sampling activities as described in Section 1. The evaluation of these samples was based on completeness of data, positive results of equipment and trip blank analysis, and relative percent differences (RPDs) of field duplicate results. E & E evaluated field dupli-

cates. Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DRM or DUSR. The field duplicate QC criteria are 40% for aqueous samples, and 70% for soil samples. The RPD ratings are listed as "Good" if the RPD is less than field duplicate QC criteria, and "Poor" if the RPD exceeded the field duplicate QC criteria. Data were qualified "J" as estimated based on the data reviewers overall evaluation of field precision and accuracy. The qualification of data because of field duplicates is discussed at the end of each DRM or DUSR.

Field blanks were evaluated for each phase of sampling as described below. Field blanks were evaluated manually based on the associated samples and matrices and shipments.

The appropriate qualifiers were added to the data to indicate potential concerns with data usability. These qualifiers were transferred to the data presented on tables in Section 3. The following qualifiers were added:

J – This qualifier indicates an estimated value because the associated QC data indicated a potential laboratory or matrix problem or interference. In addition, "J" flags assigned by the laboratory to chemical data indicate the results are below the PQL but above the instrument detection limit (IDL) or method detection limit (MDL).

R – The positive results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified. Negative radiochemical results with absolute values greater than their 2-sigma uncertainty were rejected in accordance with the USACE KC guidance document.

U – The result is considered non-detect. The laboratory assigned this flag to analytes not present at detectable concentrations (above the IDL or MDL). The data validator assigned this flag when an analyte was considered non-detect as a result of blank contamination. If the result is above the PQL, the PQL is considered elevated.

UJ – The non-detect value is considered estimated.

UR – The non-detect results were rejected because of serious deficiencies in the ability to analyze the sample. The presence or absence of the analyte cannot be verified.

The following sections summarize the data evaluation for each phase of fieldwork.

2.1 Vertical Profile Data Analysis and Review

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one

calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DRM was generated for each monitoring well drilled (multiple SDGs within each); a copy of the DRM is included in Appendix A. The results were checked for completeness and are included in Appendix B. An index of the samples and associated SDGs is provided in the beginning of Appendix A for cross reference. Tables 1 and 2 of the DRM summarize the samples and methods included for each SDG. Sample results were qualified as noted in the DRMs.

2.1.1 Field Data Quality Evaluation

Table 2.1-1 provides a summary of the field QC samples and the associated field samples. Table 2.1-2 provides summaries of the sample collection frequency for the field QC samples by method.

SW8260C	Water	195	20	10%	0	14	9	11

Key:
NA = Not Applicable

2.1.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DRM. Field duplicate results are summarized on Table 7 of the DRM. Sampling or sample handling procedures are not considered of concern because of the minimal handling by field personnel.

Field duplicate samples overall showed good precision for the analytical methods being tested. Slight variations in sample concentrations were noted in several field duplicate and parent samples causing results to be qualified "J" as estimated. No data usability concerns are present due to the analysis of field duplicate samples.

2.1.1.2 Field Blanks

Field blanks were collected when all samples were collected with disposable or dedicated equipment.

No contamination of the field blank samples was detected. These samples were driven to the laboratory by site personnel or via courier service. Trip blanks were not submitted to the laboratory due to the close proximity of the laboratory to the site.

2.1.1.3 Rinsate Blanks

A rinsate blank was collected for samples collected with reusable non-dedicated equipment.

Several rinsate blanks had VOCs and metals detections. Total uranium was detected above the reporting limit in one rinsate blank. Associated sample results were qualified as noted on the DRMs.

2.1.1.4 Drill Water Samples

A sample of drill water was collected during well drilling and consisted of the water used for well construction. The water used during drilling was analyzed for VOCs.

Acetone, methylene chloride, bromoform, dibromochloromethane, and toluene were common detections in the drill water. Acetone and methylene chloride are likely lab related contamination and were detected in laboratory method blanks, which caused the drill water results to be qualified with "U" as non-detects at the reporting limit. Bromoform and dibromochloromethane are common trihalomethanes formed from the chlorination of public drinking water.

Tert-butyl methyl ether was detected in drill water sample DW-222 below the PQL. Bromoform was detected in two groundwater samples: MW-217-VP39 and MW-220-VP40. It is possible that the drill water leaked into the drill stem and diluted the groundwater sample in these instances. The samples collected above and below the sample MW-220-VP40 have detections of benzene, PCE, and toluene that are not present in the sample itself. However, the results for MW-217-VP39 are similar to the samples taken above and below it with all the analyte results being non-detect. Tert-butyl methyl ether and toluene were detected in several samples.

TCE was detected in a drill water sample at low concentrations (less than 20 parts per billion) at the onset of the vertical profile sampling event in September 2014 at boring MW-215. This was the first vertical profile boring being conducted during this event. This initiated a work stoppage and investigation into the source of the contamination. The source of the TCE contaminant was found to be in the driller's rig transfer hosing. The transfer hosing was changed out for a new ones and drill water resampled, which confirmed the source of the TCE had been removed from the system. The Sylvania Corning FUSRAP – Drill Water TCE Summary memorandum dated October 7, 2014 (revised January 12, 2015), details the investigation. Samples of the contaminated drill water also contained trace levels of trihalomethanes as is common in public supply water treated with chlorine. Trihalomethanes were generally not present in groundwater samples collected from this boring indicating that drill water had not impacted vertical profile samples. Therefore, it was concluded that the TCE contaminated drill water did not impact the usability of that data. Monitoring well sample results collected from this location since, confirm that vertical profile samples were representative of groundwater conditions.

2.1.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that met all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DRM in Appendix A and summarized in a separate section for each analytical method described below.

2.1.2.1 Vertical Profile Groundwater Samples – Chemical Analysis

Method 8260

Methylene chloride and acetone were detected in several of the method blanks. These analytes are common laboratory contaminants. Most of the associated sample results were qualified "U" as not detected at the reporting limit. 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene were detected in one method blank. The sample results were qualified for method blank contamination as noted on the DRMs. Associated sample results were qualified "U" at the reporting limit if less than five times the blank value (ten times the blank value for common laboratory contaminants).

Surrogate spike recoveries were generally within laboratory defined QC guidelines with a few exceptions that generally did not cause qualification of sample results.

Several analytes were outside of acceptance criteria in the laboratory control samples (LCS). For LCS recoveries that were high and the analyte was not detected in the associated samples, no qualification of the data was made. For recoveries that failed either high or low and the analyte was detected in the samples, the sample results were qualified "J" as estimated. If the recovery of the LCS was below acceptance criteria and the analyte was not detected in the samples, the sample results were qualified "UJ" as estimated non-detect.

Matrix spike samples and duplicates were analyzed for the vertical profile samples by Method SW8260C. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. The result in the parent sample was qualified "J" as estimated for spike recoveries that were outside of acceptance criteria. If the spike was recovered low and the result was non-detect in the parent sample, then the result was qualified "UJ" as estimated non-detect. No qualification of the data was made when the native sample concentration was greater than four times the spiking concentration, or if the spike recovery was high and the sample result was non-detect. Several analytes were recovered low in MS and/or MSD for sample MW-220-VP28. All of the recoveries were low, indicating a laboratory spiking error rather than an instrument or matrix issue. The spiking error also caused several analytes to exhibit poor precision between the MS and MSD. No qualification of the data was made. For sample MW-222-VP36, the MS recovery for chloroethane was within acceptance limits and the MSD recovery was 0%; therefore, the RPD also was outside acceptance limits (it appears that the sample was not spiked for this compound) and the chloroethane result for sample MW-222-VP36 was qualified with "UJ" as estimated non-detect. Several other MS/MSD pairs had recoveries and/or RPDs that were outside of laboratory acceptance criteria.

Several samples were diluted due to analytes exceeding the calibration curve or due to the nature of the matrix. In some cases, only the analyte that exceeded was reported at the dilution with no impact to the remaining analyte results; in other

cases, all of the analytes were reported at the dilution; therefore, elevated reporting limits were provided, which may have impacted comparability.

PCE exhibited a percent difference between calibration and verification (% D) above laboratory limits for batch 1412008. Since PCE is a compound of concern, it was reanalyzed with confirmatory results; therefore, the original results were reported.

Method 6010

Arsenic, calcium, selenium and zinc were detected in method blanks for Method SW6010B. Sample results were qualified for method blank contamination as noted on the DRMs. Associated sample results were qualified "U" at the reporting limit if less than five times the blank value.

Several MS/MSD pairs had recoveries and/or RPDs that were outside of laboratory acceptance criteria.

Several samples were diluted due to analytes exceeding the calibration curve or due to the nature of the matrix. In some cases only the analyte that exceeded was reported at the dilution with no impact to the remaining analyte results; in other cases, all of the analytes were reported at the dilution; therefore, elevated reporting limits were provided.

2.1.2.2 Vertical Profile Groundwater Samples – Radiological Analysis

Method ASTM D5174

For total uranium analysis, several samples required dilution and reanalysis to eliminate quenching due to the sample matrix. Several samples were spiked and reanalyzed to confirm original results or determine whether quenching occurred. The reported results are considered valid and usable without qualification.

2.2 Monitoring Well Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG. Sample results were qualified as noted in the DUSRs.

SW8260B	Groundwater	180	19	11%	16	4

Key:
NA = Not applicable.

2.2.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 7 of the DUSR. Overall, field duplicate precision was good. Acetone results were qualified with "J" as estimated for the field duplicate sample pair for sample MW-225-330-SP16 due to poor precision.

2.2.1.2 Rinsate Blanks

Rinsate samples were collected at a rate of one every 45 groundwater samples. The bulk of the groundwater sampling equipment was dedicated pumps and tubing.

2-utanone and acetone were detected in rinsate blanks RB01-SP15, RB02-SP15, RB03-SP15, and RB-01 (Spring 2016). 2-hexanone, were detected in RB03-SP15 and chloroform was detected in rinsate blank RB-01 (Spring 2016).

2.2.1.3 Trip Blanks

Trip blank samples were collected at a rate of one every 11 groundwater samples (one for every cooler shipped with VOC samples).

Acetone was detected in all the trip blanks except Trip blank-SP16. 2-butanone (methyl ethyl ketone [MEK]) was detected in Trip Blanks 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 12, and 13. Carbon disulfide was detected in Trip Blank 08. 2-hexanone and toluene were detected in Trip Blanks 12 and 13. Acetone and 2-butanone are common laboratory contaminants.

2.2.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Tables 3 through 7 in the DUSR provide a list of sample results qualified and the reason for data qualification.

2.2.2.1 Groundwater Samples – Chemical Analysis

Method 8260

Results for 2-butanone, and acetone were ”U” qualified as non-detect in several samples due to positive detections in Trip Blanks 01, 02, and 03. If the sample result was less than the PQL, the MDL was elevated to the sample result; however, if the sample result was greater than the PQL, then the PQL was elevated to the sample result. The sample results for acetone were ”U” qualified as non-detect due to trip blank contamination in samples MW-215-395-SP15, MW-216-510-SP15, MW-202-495-SP15, MW-208-350-SP15, MW-208-540-SP15, MW-26S-SP15, MW-905-SP15, MW-207-170-SP15, W-25-150-SP15, MW-910-SP15, W-14-150-SP15, W-31-95-SP15, PW-02-06-SP15, MW-209-380-SP15, MW-205-285-SP15, MW-210-380-SP15, MW-915-SP15, PW-06-06-SP15, MW-211-455-SP15, MW-213-570-SP15, and MW-211-190-SP15, MW-204-470-SP15, S-1-325-SP15, RB01-SP15. RB02-SP15, and RB03-SP15. The sample results for 2-butanone were ”U” qualified as non-detect due to trip blank contamination in samples MW-52D-SP15, MW-205-285-SP15, RB01-SP15, RB02-SP15, and

RB03-SP15. The sample result for carbon disulfide was ”U” qualified as non-detect due to trip blank contamination in sample W-25-150-SP15. The sample results for 2-hexanone were ”U” qualified as non-detect due to trip blank contamination in samples MW-205-285-SP15 and RB03-SP15. The sample result for chloroform was ”U” qualified as non-detect due to rinsate blank contamination in sample MWP-110-440-SP16.

Recoveries for surrogate spike compounds 4-bromofluorobenzene and/or toluene-d8 were above control limits for several samples. Detected analyte results for samples MW-59S-SP15, MW-215-395-SP15, MW-58S-SP15, MW-904-SP15, MW-217-490-SP15, MW-14D-SP15, MW-18S-SP15, MW-20I-SP15, MW-20S-SP15, MW-25S-SP15, MW-41S-SP15, MW-202-380-SP15, W-24-260-SP15, and MW-P114-290-SP15 were qualified with “J” as estimated. Recovery for surrogate compound dibromofluoromethane was above acceptance criteria in the dilution analysis of MW-12-SP15 and in samples MW-3-SP15 and MW-205-470-SP15; PCE and/or TCE were detected in the samples and qualified “J” as estimated.

LCS recoveries of cyclohexane, methylcyclohexane, 1,1,2,2-tetrachloroethane, and methyl acetate were above acceptance criteria in several LCSs and laboratory control sample duplicates (LCSDs). The results for the associated samples were non-detect for the analytes; therefore, no qualification of the data was made.

Recovery for 1,2-dibromoethane (ethylene dibromide [EDB]) was above the control limits for the MS for sample MW-49S-SP15; however, the MSD and RPD were within acceptance criteria and EDB was not detected in the parent sample; therefore, no qualifiers were added. Cyclohexane was recovered above the control limits in the MS/MSDs of MW-20S-SP15, MW-08-71-SP15 W-10-120-SP15. The associated LCS/LCSDs were also non-compliant and cyclohexane is a poor performer per EPA SOP USEPA-540-R-08-01. The results were non-detect in the parent samples; therefore, no qualification of the data was made. Cyclohexane, methylcyclohexane, and acetone were recovered above the control limits in the MS/MSD of MW-205-285-SP15. The analytes are poor performers and were not detected in the parent sample. No qualification of the data was made. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSDs of MW-55S-SP15, W-26-270-SP15, MW-912-SP15, W-08-71-SP15, W-10-120-SP15, MW-205-285-SP15, MW-212-580-SP15, PW-07-06-SP15, and MW-15D-SP15. The LCS/LCSDs for the analyte was also non-compliant and the sample results for the analyte were already “UJ” qualified for continuing calibration verification (CCV) standard failures. Styrene was recovered below the control limits in the MS/MSD of W-10-120-SP15. The analyte was not detected in the samples, and the parent sample results was qualified “UJ” as estimated non-detect.

2-Butanone exhibited poor precision between the MS and MSD in sample MW-912-SP15. 2-Butanone is a poor performer and the individual recoveries were acceptable; therefore, the data were not qualified.

Sample results for bromoform, 1,3-dichlorobenzene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene were "UR" qualified as rejected non-detect due to internal standard failures in samples MW-206-470-SP15, MW-210-280-SP15, MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-210-280-SP15, and MW-210-380-SP15. These wells were not resampled because the analytes and samples were not considered critical to the site investigation. Sample results are available from four other sampling events for the same wells.

For several analytical batches the following poor performing analytes exhibited relative response factor (RRF) values less than the laboratory minimum criterion of 0.1000 in the CCV: acetone, methyl acetate, 2-butanone, 4-methyl-2-pentanone (methyl isobutyl ketone [MIBK]), 2-hexanone, and 1,2-dibromo-3-chloropropane. The RRF values were ≥0.0100; the allowance for poor performing analytes per EPA Region 2 SOP HW-33, Rev 3. The %RSD was acceptable and the associated results were non-detect for the analytes. No qualification of the data was made. The following poor performing analytes exhibited RRF values less than the laboratory minimum criterion of 0.1000 in the CCV associated with batches 246272 and 246258: acetone, methyl acetate, 2- butanone, 4-methyl- 2- pentanone and 2-hexanone. A low level CCV was analyzed at the reporting limit (1 µg/L) and the affected analytes were detected for both batches. Target analytes detected above the reporting limit were qualified with "J" as estimated and analytes below the reporting limit were qualified with "UJ" as estimated non-detect.

The RRF for 1,1,2,2-tetrachloroethane was less than the laboratory minimum of 0.300 in several of the initial calibration verifications (ICVs) and CCVs; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.

For several CCVs, the following analytes exceeded the control limit of 20% D: bromomethane, chloroethane, 2-butanone, dichlorodifluoromethane, 1,1,2,2-tetrachloroethane, trichlorofluoromethane, carbon tetrachloride, and styrene. No qualification of the data was made for the non-detect results. Carbon tetrachloride was detected in sample MW-219-560-WI15, which was reanalyzed under an acceptable CCV and only the carbon tetrachloride was reported form the re-analysis without qualification. The associated styrene results were qualified "UJ" as estimated non-detect. 1,1,2,2-tetrachloroethane was not detected in the associated samples; therefore, the sample results were qualified "UJ" as estimated non-detect.

1,1,2,2-tetrachloroethane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene exhibited percent difference between the calibration and verification standard results (%D) above the control limit of 25% in several CCVs. EPA SOP USEPA-540-R-08-01 allows %D up to 25%. The analyte was not detected in any of the samples; therefore, the associated sample results were qualified "UJ" as estimated non-detect.

1,1,2,2-tetrachloroethane and dichlorodifluoromethane exhibited %D for several ICVs that exceeds the EPA SOP USEPA-540-R-08-01 acceptance criteria of 40% for a poor performer. The associated sample results were non-detect; therefore, they were qualified "UJ" as estimated non-detect. In many instances, the associated sample results were already qualified "UJ" due to CCV failures.

Samples MW-219-560-WI15, MW-220-325-WI15, MW-58-75-WI15, MW-607-WI15, MW-219-560-SP15, MW-220-325-SP15, MW-58S-SP15, MW-904-SP15, and MW-P114-170R-SP15 were diluted due to elevated levels of PCE and/or TCE. Only the target analytes were reported from the dilution and there was no impact on data usability.

The following samples were diluted due to target analytes exceeding the calibration curve: MW-43S-SP15, MW-208-350, MW-202-380-SP15, MW-33D-SP15, MW-52D-SP15, W-20-160-SP15, MW-53S-SP15, MW-907-SP15, MW-207-170-SP15, MW-906-SP15, W-19-150-SP15, MW-33S-SP15, MW-44S-SP15, W-23-110-SP15, W-14-130-SP15, MW-908-SP15, MW-12-SP15, W-18-150-SP15, W-37-385-SP15, MW-909-SP15, MW-910-SP15, W-01-75-SP15, W-16-148-SP15, W-37-325-SP15, MW-4-SP15, MW-9-SP15, W-12-120-SP15, W-27-285-SP15, PW-02-07-SP15, W-32-110-SP15, MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-205-285-SP15, MW-210-280-SP15, MW-915-SP15, and MW-210-380-SP15 as well as several samples from SP16. Only the target analytes were reported from the dilution and there was no impact on data usability.

MW-219-560-WI15 and MW-220-325-WI15, MW-219-560-SP15, MW-220-325-SP15, and MW-904-SP15 MW-202-380-SP15 MW-53S-SP15, MW-907-SP15, MW-207-170-SP15, MW-906-SP15, W-19-150-SP15, and MW-33S-SP15 W-14-130-SP15, MW-908-SP15, and MW-12-SP15 W-16-148-SP15 and W-37-325-SP15 W-10-120-SP15, W-36-390-SP15, W-36-448-SP15, MW-209-380-SP15, and MW-914-SP15 MW-10-SP15 MW-204-320-SP15 MW-P110-355-SP15 and MW-P110-440-SP15 were initially analyzed at dilutions prior to being further diluted due to target analytes exceeding the calibration curve. Elevated reporting limits are provided for non-detect analytes; data comparability may be impacted.

Samples MW-203-160-SP15, MW-203-360-SP15, MW-22S-SP15, MW-24S-SP15, MW-28S-SP15, MW-29S-SP15, and MW-39S-SP15 were diluted due to high concentrations of analytes. Elevated reporting limits are provided as applicable. Only one result is reported per analyte per sample; data comparability may be impacted.

Method 8260B SIM

Internal standard area responses were outside of control limits for several samples. 1,4-Dioxane-d8 was recovered low in sample MW-216-510-WI15. The laboratory reanalyzed the sample and the failure was reproduced, which indicates matrix effects. The sample result was qualified "J" as estimated.

Method 6010B

Iron, lead, manganese, nickel, sodium, and thallium were recovered above control limits in the MS/MSD of MW-211-455-SP15. The results for those analytes were "J" qualified as estimated if detected in the parent sample. No qualification was made for analytes that were non-detect.

Samples MW-59S-SP15 and MW-58S-SP15, MW-211-455-SP15, and MW-211-455-SP15-F were diluted due to the nature of the matrix. Elevated reporting limits are provided, which may impact data comparability.

Calcium was recovered above control limits in serial dilution of sample MW-211-455-SP15. The calcium results were qualified "J" as estimated in MW-211-455-SP15 and MW-211-455-SP15-F.

2.2.2.2 Groundwater Samples – Radiological Analysis

Method A-01-R (Isotopic Thorium and Uranium)

No analytical or quality issues were noted.

Method ASTM D 5174

Several samples were reanalyzed with a dilution and/or post-spike to check for quenching; only one result is reported per sample. Several samples with low uranium concentrations were reprepped and reanalyzed due to method blank contamination in the initial batch. No qualifiers were required.

Uranium was detected in a method blank above the PQL; however, the associated sample results were all greater than ten times the blank concentration; therefore, no results were qualified.

MS/MSD recoveries were above acceptance criteria for sample MW-20S-SP15; however, the sample concentration was more than five times the spike amount; therefore, no qualifiers were required.

Several samples were reanalyzed due to LCS noncompliance; only one result was reported per sample and no qualifiers were required.

Sample W-02-70-SP15 matrix was orange in color and caused interference during analysis. The sample was wet-ashed, treated in a muffle furnace, diluted 10X, and treated with a post-spike due to matrix effects and quenching, resulting in an elevated detection limit; the result was qualified with "UJ" as not detected above the minimum detectable concentration (MDC), which is considered estimated or uncertain.

2.3 Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one

calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Sample results were qualified as noted on the DUSRs.

Sample Delivery Group for Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge Sampling	Laboratory
160102301	TestAmerica St. Louis

2.3.1 Field Data Quality Evaluation

Table 2.3-1 provides a summary of the field QC samples and the associated field samples. Table 2.3-2 provides summarizes the sample collection frequency for the field QC samples by method.

2.3.1.1 Field Duplicates

There were no field duplicate samples collected for this work.

2.3.1.2 Trip Blanks

There were no trip blank samples collected for this work.

2.3.1.3 Field Blanks

There were no field blank samples collected for this work.

2.3.2 Laboratory Data Quality Evaluation

These data were not validated because they were requested as quick-turn analyses and the end use of the data was for waste characterization. These results are considered usable for this purpose as reported. The data evaluation discussed below is taken form the laboratory case narrative for this work.

2.3.2.1 Concrete, Asphalt Waste and DR-Z Sludge Samples – Chemical Analysis

Sample DR-Z SLUDGE WC (160-12304-6) was received at the laboratory with limited sample volume. An analytical priority list was provided to the laboratory; therefore, PCBs and paint filter analyses were not performed. Reduced sample aliquots were used for the remaining analyses requested.

Method SW6010

The following samples were diluted to bring the concentration of target analytes within the calibration range: CONCRETE OUTSIDE WC, ASPHALT OUTSIDE WC, AREA 1/5 SS WC, AREA 2/3 SS WC, CONCRETE INSIDE WC, and DR-Z SLUDGE WC. Elevated reporting limits are provided.

Method 7471

The following sample was diluted to bring the concentration of target analytes within the calibration range: DR-Z SLUDGE WC. Elevated reporting limits (RLs) are provided.

Due to the high concentration of Mercury, the MS/MSD of sample DR-Z SLUDGE WC could not be evaluated for accuracy and precision. The associated LCS met acceptance criteria.

Method 8081

No analytical or quality issues were noted.

Method 8082

There was insufficient sample remaining to perform PCBs analysis on sample DR-Z SLUDGE WC.

The LCS surrogate recovery for the following samples was outside acceptance limits (high biased) on the primary column due to matrix interference. The recovery is within acceptance limits on the other column, indicating that the extraction process was in control. The associated samples were non-detect for target analytes; therefore, the sample data have been reported.

The CCV recoveries for surrogate compound decachlorobiphenyl, PCB-1254 on the primary and confirmation column and PCB-1260 on the confirmation column were outside the QC limits. The surrogate recoveries in the associated samples are within acceptance criteria, and the sample results are non-detect; therefore the sample data have been reported.

Method 8151

The CCV recovery for 2,4-D was outside the QC limits on the confirmation column. The associated sample results were non-detect for target analytes, and did not require confirmation; therefore the sample data have been reported.

The continuing CCV recovered above the upper control limit for 2,4-D on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes and do not require confirmation; therefore, the data have been reported.

Method 8260 (Toxicity Characteristic Leaching Procedure [TCLP])

The following compounds did not meet the minimum relative response factor limits in the CCV: isopropyl alcohol, acetone, methyl acetate, n-butanol, 2-pentanone, 2-hexanone and 2-butanone. A low-level CCV was analyzed at the reporting limit and the affected analytes were detected. Target analytes recovering above the reporting limit were qualified and reported.

The following compounds did not meet the minimum relative response factor limits in the CCV: ethanol, isopropyl alcohol, acetone, methyl acetate, n-butanol, 2-hexanone and 2-butanone. A low-level CCV was analyzed at the reporting limit (5 µg/L) and the affected analytes were detected. Target analytes recovering above the reporting limit were qualified and reported.

The CCV recovered above the upper control limit for carbon tetrachloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270 (TCLP)

The LCS and LCSD recovered outside upper control limits for pyridine. This analyte was biased high in the LCS/LCSD and was not detected in the associated sample; therefore, the data have been reported.

Method 9012

The following sample had an LCS recovery that failed low: DR-Z SLUDGE WC. Due to the status of method 7.3.3 being unapproved, the acceptance criteria for the method are considered to be advisory limits. Sample DR-Z SLUDGE WC was prepped and analyzed only once, but as there was insufficient sample remaining for re-prep and analysis, the data are being reported. The lab is investigating the cause of the recent lower recoveries.

Method 9034

No analytical or quality issues were noted.

Method 9045

The following samples have results greater than the upper calibration standard of 10 SU: CONCRETE OUTSIDE WC and CONCRETE INSIDE WC. Results were reported.

Method 9095
No analytical or quality issues were noted.

2.3.2.2 Concrete, Asphalt Waste and DR-Z Sludge Samples – Radiological Analysis

Method A-01-R (Isotopic Thorium and Uranium)
No analytical or quality issues were noted.

Method Ga-01-R (Radium-226, No Ingrowth)
Sample DR-Z SLUDGE WC was analyzed for radium 226 (No ingrowth) in accordance with Ga-01-R. Insufficient sample was available to fill the client requested tuna can geometry. A 25mL solid geometry was used instead.

Radium-226 by gamma spectroscopy is typically determined by inference from daughters (e.g., bismuth-214) after sealing the sample in an appropriate counting geometry/container and waiting 21 days to allow the radium-226 decay chain through radon-222 to reach secular equilibrium. Such an approach is considered to be the most reliable and representative means for establishing the true radium-226 concentration in the sample. The method requested by the client to report radium-226, using its own 186 keV gamma-ray emission, is subject to interference and potential bias due to the 185.7 keV uranium-235 gamma ray. Experience also indicates gamma spectroscopy software does not consistently assign accurate peak areas to radium-226 (186 keV), with the problem compounded by slight drift of the instrumentation. The laboratory considers radium-226 reported based upon the 186 keV gamma-ray emission to be best used by the client in a qualitative fashion.

The MDC was greater than the requested limit of 1 pCi/g for radium-226. Radium-226 was requested to be reported with no ingrowth for this batch; therefore, the samples were reported from the only usable gamma energy line, 185.99 keV. This energy line has a low efficiency, which causes an elevated MDC. Using the 185.99 keV line to report radium-226 can cause potential high bias in the results due to potential interference from the uranium-235 energy line of 185.72 keV. The sample result is reported; however, it should be considered to have a high bias.

Method Ga-01-R (Radium-226, 21 Day Ingrowth)
Cesium-137 and cobalt-60 exceeded the RPD limit for the duplicate of sample CONCRETE OUTSIDE WC.

2.4 CSIA Data Analysis and Validation
The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. An Evaluation Memorandum was generated for both

SDGs reported and the extracted section titled "Verification of CSIA Data" is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. "Verification of CSIA Data" summarizes and evaluates the samples and methods included for both SDGs.

Sample Delivery Groups for CSIA Sampling	Laboratory
16051951	TestAmerica St. Louis/Microseeps
16052541	TestAmerica St. Louis/Microseeps

2.4.1 Field Data Quality Evaluation

VOC precision and sensitivity were assessed by reviewing field quality control samples: such as VOC trip blank, VOC rinse blank for soils, and field duplicates. The conclusion of the data verification is that the isotopic and VOC concentration data are not impacted by field sampling and handling.

2.4.1.1 Field Duplicates

See "Verification of CSIA Data" in Appendix A. The field duplicate samples collected from 2009 to 2013 were compared to the parent samples to assess the sampling and laboratory precision (refer to Figure 1a and to Figure 1b). Field duplicates for TCE, PCE, and Total VOC provided reproducible results within 15 percent; note the regression lines in Figures 1A and 1B (Parent and Field Duplicate Samples Comparison) had slopes greater than 0.88 (with regression coefficients (R2) greater than 0.97, indicating comparability). The field duplicates for the isotopic data were also compared to parent samples; however, comparison was limited to three matched pairs. Figure 2 shows PCE isotopic carbon signature (δC13) and the isotopic chlorine signature (δCl37) between parents and duplicate samples relative to the 1:1 line. Similarly, Figure 3 shows TCE isotopic ratio of δC13 and δCl37 between the parent and duplicate samples. Duplicate samples showed a percent difference less than 16 percent (refer to Table 1 for values).

2.4.1.2 Field Blanks

See "Verification of CSIA Data" in Appendix A. The VOC trip blank and VOC rinse blank collected in August 2013 had non-detected concentrations for PCE and TCE.

2.4.2 Laboratory Data Quality Evaluation

These data were verified and not validated. These results are considered usable for this purpose as reported. The data evaluation discussed below is taken form "Verification of CSIA Data" in Appendix A.

2.4.2.1 CSIA Samples – Chemical Analysis

Method 8260

See "Verification of CSIA Data" in Appendix A. In addition to analyzing the isotopic ratio in the groundwater samples, Microseeps reported the TCE and PCE concentrations. These VOC data from Microseeps supplement the 2013 routine groundwater monitoring samples that were analyzed by Test America. As an independent check on accuracy, the TCE and PCE concentrations from samples analyzed by Microseeps and TestAmerica were compared; the TCE and PCE concentrations from both laboratories are comparable. A review of the laboratory data packages confirms that the laboratory followed standard operating procedures and that the laboratory performance criteria were met.

2.4.2.2 CSIA Samples – Isotope Analysis

For the isotope results, the laboratory blank samples reported non-detected concentrations for the PCE and TCE isotopic ratios.

Method CSIA- PCE/TCE C/Cl/H

A review of the laboratory data packages confirms that the laboratory followed standard operating procedures and that the laboratory performance criteria were met.

Method CSIA- PCE only (Chlorine and Carbon)

A review of the laboratory data packages confirms that the laboratory followed standard operating procedures and that the laboratory performance criteria were met.

2.5 Building 70 Waste Drain Investigation Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG. Sample results were qualified as noted on the DUSRs.

2.5.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 7 of the DUSR. Overall, field duplicate precision was good. RPD acceptance criteria were exceeded for potassium-40 and iron for the field duplicate sample pair for DRYH-G-Z6; those results were qualified ”J” as estimated. The sample results for aluminum and copper exhibited poor precision in the field duplicate of DRY-E-B1-23-Z3. The results were qualified ”J” as estimated. The precision for the uranium-238 results for the field duplicate sample pair for DRY H-H-L1 was outside acceptance criteria; the results were qualified with “J” as estimated for detected results or “UJ” as estimated non-detect.

2.5.1.2 Trip Blanks

Trip blanks were collected at a rate of one every 6 samples (one for every cooler shipped with VOC samples). A trip blank was not provided in the coolers with samples for VOCs analysis for SDGs 16092021, 16092451, or 16092491. Chloroform was detected in trip blanks, DI-TB1 and DI-TB2 and 2-butanone (MEK) and acetone were detected in trip blank 060215 by Method 8260.

2.5.1.3 Rinsate Blanks

Rinsate samples were collected at a rate of one every 18 samples. 2-Hexanone, acetone, methyl ethyl ketone (2-butanone), and methylene chloride were detected in rinsate blank RB-06 and 2-butanone and acetone were detected in the rinsate blank DI-RB1 by Method 8260. Iron, lead, selenium, vanadium, and zinc were detected in rinsate blank RB-06 and iron and manganese were detected in rinsate blank DI-RB1 by Method 6010B.

2.5.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Tables 3 through 7 in the DUSR provide a list of sample results qualified and the reason for data qualification.

2.5.2.1 Building 70 Waste Drain Investigation Samples – Chemical Analysis

Method 8260

1,2,4-trichlorobenzene, 1,2,3-trichlorobenzene, 1,2-dichloroethane, ethylbenzene, 1,3-dichlorobenzene, 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene were detected in method blanks.

Acetone results were "U" qualified in several samples due to positive detection in TRIP BLANK 060215.

Several sample results were "U" qualified due to rinsate blank contamination in RB-06 and acetone and 2-butanone were "U" qualified in several samples due to positive detections for the analytes in the rinsate blank DI-RB1.

Due to matrix interferences, surrogate recoveries for 1,2-dichloroethane-d4, toluene-d8, 4-bromofluorobenzene and/or dibromofluoromethane were below control limits for the following samples: DRYH-G-WEST-2, DRYH-G-EAST, DRYH-G-NORTH, DRYH-G-Z4, and DR-BB-PIPE-SLUDGE. The results were qualified "J" as estimated for detected results or "UJ" as estimated non-detect.

Surrogate recoveries for 1,2-Dichloroethane-d4 and/or toluene-d8 and/or 4-bromofluorobenzene were above control limits in several samples. The results for detected compounds in the samples were qualified "J" as estimated. No qualification was made on non-detect results, the method blank, or the MS/MSD samples.

The internal standards DCB, 1,4-dichlorobenzene-d4, and chlorobenzene-d5 exhibited area counts less than the low limit in several samples. The sample results for DRY-F-WEST-2 were already qualified "J" as estimated for detected results or "UJ" as estimated non-detect for surrogate failures; the failures are likely due to the nature of the matrix. The detected results for samples DRYH-H-SG1, DRYH-H-SG2, DRYH-H-SG3 (reanalysis), DRYH-H-SG1, DRYH-H-SG2, DRYH-I-SG1, and DRY-H-J-SG3 were qualified "J" as estimated and the non-detect results were qualified "UR" as rejected.

Sample DRYH-H-B1-21-Z23 exhibited internal standard recoveries outside of control limits. The sample was reanalyzed within hold time with acceptable results. The re-analysis results are reported.

The following samples were run at medium level due to high concentrations of target analytes and sample matrix issues: DRYH-G-Z4, DRYH-G-EAST, DRYH-G-NORTH, DRYH-G-WEST-1, DRYH-I-SG1, and DR-BB-SLUDGE. Elevated reporting limits were provided. This may impact data comparability.

Acetone, 2-butanone, 4-methyl-2-pentanone (MIBK), 2-hexanone, 1,2-dibromo-3-chloropropane, methyl acetate, and 1,1,2,2,-tetrachloroethane exhibited relative response factors (RRF) less than the laboratory minimum in several analytical batches. The analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.

Dichlorodifluoromethane exhibited a %D above laboratory control limits in several initial calibration verification (ICV) standards. The analyte is a poor performing compound per EPA SOP USEPA-540-R-08-01 and allowed up to 40% D. Styrene exhibited a %D above laboratory control limits in several ICVs. Per EPA SOP USEPA-540-R-08-01 analytes are allowed up to 25% D. No qualification of the data was made.

1,2,4-trichlorobenzene exhibited a %D above laboratory control limits in several CCVs. Per EPA SOP USEPA-540-R-08-01 analytes are allowed up to 25% D. No qualification of the data was made. Methyl acetate exhibited a %D above laboratory control limits in several CCVs. Per EPA SOP USEPA-540-R-08-01 analytes are allowed up to 40% D. No qualification of the data was made.

The laboratory did not log in sample DRYH-G-Z8 for VOCs analysis; therefore, VOC results are not available. This sample was at the bottom of a boring and the six samples collected above it did not indicate migration of VOCs through the subsurface at this location. Given the minor impact to data interpretation, the effort to recollect the sample was not considered necessary.

Insufficient sample volume was available to perform MS/MSD analyses with several analytical batches; however, LCS/LCSDs were analyzed instead, which is acceptable.

1,2-Dibromoethane was recovered high and methylcyclohexane was recovered low in the MS/MSD of sample DRYH-H-L1; no qualification was made for 1,2-dibromoethane and methylcyclohexane was already “UJ” qualified due to LCS failure.

26 analytes failed recovery in the MS/MSD of DRYH-I-SG1; however, the sample results were already qualified for internal standard and surrogate failures.

The following analytes failed recovery low in LCS/LCSDs associated with sample analytical batches: chloroethane, chloromethane, cyclohexane, dichlorodifluoromethane, methylcyclohexane, trichlorofluoromethane, and vinyl chloride. All of the analytes except vinyl chloride are poor performing compounds per EPA SOP USEPA-540-R-08-01 in a multi-parameter spike. The associated sample results were qualified "J" as estimated for detected results or "UJ" as estimated non-detect.

Method 6010

Many of the sample digestates were oily with a high viscosity, which resulted in the laboratory performing dilutions on them prior to analysis.

Parent sample results were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect due to MS/MSD failures.

Thallium results for sample DRYH-G-WEST-1 were rejected due to 0% recoveries in the MS/MSD and low post-digestion spike (PDS) recovery.

Several metals (arsenic, copper, lead, nickel, selenium, silver, zinc, and calcium) were detected in the method blanks associated with the samples. Beryllium, vanadium, copper, cadmium, lead, selenium, silver, and arsenic were detected in several of the initial calibration blanks (ICBs) and/or continuing calibration blanks (CCB). Arsenic results for the associated samples were "U" qualified as non-detect due to method blank contamination. Several samples were "U" qualified as non-detect for cadmium, copper, lead, and vanadium due to detections in the CCB. Beryllium was non-detect in the associated samples; therefore, no qualification of the data was required. Associated sample results for nickel, calcium and zinc were greater than five times the laboratory blank detection; therefore, no qualification of the data was required. Two samples were "U" qualified for selenium detection in the CCB. Five samples were "U" qualified for silver detections in the ICB or CCB. Two samples were "U" qualified for lead detection in the RB. One sample was "U" qualified for selenium detection in the RB. Seven samples were "U" qualified for vanadium detection in the RB, and five samples were "U" qualified for zinc in the RB.

Chromium, copper, and lead were recovered high in the contract required quantitation limit check standards (CRI). The associated sample results were non-detect or were bracketed by a CCV at the same concentration and the same source as the CRI, which were within acceptance criteria; therefore, the data was not qualified.

The post-digestion spike (PDS) recovered high for chromium in sample DRYH-H-L1. The individual recoveries were acceptable in the MS/MSD; therefore, no qualification of the data was made. A PDS recovered high for chromium and lead; the parent sample results were qualified with "J" as estimated.

Several metals failed recovery in the MS/MSD of DRYH-I-SG1, and in several cases, the PDS also failed recovery. The recoveries were generally higher in the

MSD than the MS, which resulted in several analytes exhibiting poor precision. The results are likely related to matrix effects. The results exhibiting failures were qualified "J" as estimated. No qualification was made on results where the native concentration was greater than four times the spiking concentration.

The MS/MSD recoveries for sample DRYH-J-SG1 for aluminum, copper, iron, and zinc were outside acceptance criteria. The parent sample results for aluminum, copper, and zinc were qualified with "J" as estimated. The parent sample result for iron required no qualification because the sample concentration exceeded the spike concentration more than four times.

MS recovery for potassium was outside acceptance criteria; however, the MSD and RPD as well as the LCS were acceptable; therefore, no qualifiers were added.

Method 6020A

Uranium-238 was detected in a method blank.

Several samples were diluted due to the sample matrix; elevated reporting limits were provided.

The MS/MSD recoveries for uranium-236 in sample DRYH-G-WEST-1 were below acceptance criteria. The results were qualified "J" as estimated with a low bias. The MS/MSD recoveries for sample DRYH-J-SG1 for uranium-234, uranium-235, and uranium-238 and for sample DRYH-I-SG1 for uranium-238 were outside acceptance criteria. No qualifiers were required because the sample concentration exceeded the spike concentration by more than four times. The MSD recovery for uranium-234 was high; however, the parent sample result was non-detect; therefore, no qualification of the data was made.

The samples were diluted prior to analysis due to the nature of the matrix or high target analyte concentrations. The following samples had non-detect values and are reported with elevated reporting limits: DRYH-G-WEST-2, DRYH-G-Z3, DRYH-G-Z5, DRYH-G-Z501, DRYH-G-Z6, DRYH-G-Z7.

Method 7471B

The following samples were re-extracted and analyzed outside of hold time for mercury analysis by Method 7471B. The laboratory noted a software malfunction resulting in the loss of initial data results: DRYH-G-Z3, DRYH-G-Z4, DRYH-G-Z5, DRYH-G-Z501, DRYH-G-Z6, DRYH-G-Z7, DRYH-G-EAST, DRYH-G-NORTH, DRYH-G-WEST-1, DRYH-G-WEST-2. The positive detections were qualified "J-" as estimated with a low bias. The non-detect results were qualified "UR" as rejected non-detect. Because mercury is not a likely site contaminant and there would be a minor impact on data interpretation, the effort to recollect the sample was not considered necessary.

The MS recovery for mercury was outside the acceptance criteria; however, the MSD and RPD as well as the LCS were acceptable; therefore, no qualifiers were added.

2.5.2.2 Building 70 Waste Drain Investigation Samples – Radiological Analysis

Method ASTM D-5174
Samples DRY H-H-L1, DRY H-H-L300, and D1-RB1 (reprepped due to MS/LCS failure in first batch) were treated with a post spike to test for quenching. The post-spike verified the initial results, so the initial results were reported.

Method A-01-R (Isotopic Thorium and Uranium)
Thorium-230 and thorium-228 were detected in the method blanks. "J" qualifiers were added to the thorium-230 results for samples DI-RB1, DRYH-H-L1, and DRYH-H-L300 for method blank contamination.

For sample DRYH-I-SG1, MS/MSD recoveries for uranium-233/234 were above acceptance criteria. A matrix effect is suspected; therefore, the parent sample result was qualified with "J" as estimated.

Method Ga-01-R (Gamma Spectroscopy)
No analytical or quality issues were noted.

Method 9315 (Radium-226 by Gas Flow Proportional Counting [GFPC])
No analytical or quality issues were noted.

Method 9320 (Ra-228 by GFPC)
No analytical or quality issues were noted.

2.6 Septic Tank Data Analysis and Validation

The samples were grouped by the laboratories into SDGs of various numbers of samples. An SDG is defined as a batch of up to 20 samples collected during one calendar week. Samples shipped on Friday will normally conclude an SDG. The SDGs are listed below. A DUSR was generated for each SDG reported and a copy of the DUSR is included in Appendix A. The results were checked for completeness and are included in Appendix B. Summary tables of the samples and associated SDG are provided in the beginning of each appendix for cross reference. Tables 1 and 2 of the DUSR summarize the samples and methods included for each SDG. Sample results were qualified as noted on the DUSRs.

Sample Delivery Groups for Septic Tank Sampling	Laboratory
16086841	TestAmerica St. Louis
16086431	TestAmerica St. Louis/General Engineering Laboratories
16053001	TestAmerica St. Louis

Sample Delivery Groups for Septic Tank Sampling	Laboratory
16048891	TestAmerica St. Louis
16048892	TestAmerica St. Louis
16048894	TestAmerica St. Louis
16048895	TestAmerica St. Louis

2.6.1 Field Data Quality Evaluation

Table 2.6-1 provides a summary of the field QC samples and the associated field samples. Table 2.6-2 provides summarizes the sample collection frequency for the field QC samples by method.

Table 2.6-1 Field QC Associations for Septic Tank Samples, Sylvania Corning FUSRAP Site

Field QC Sample ID	Client Sample ID	QC Type	SDG
STB-01-500	STB-01-Z5	FD	16086431
STB-02-500	STB-03-Z2	FD	16086841
STS-801-FA13	STS-01-FA13	FD	16048895
TB01-FA13	TB01-FA13	TB	16048892
TB04	TB04	TB	16053001

Key:
TB = Trip Blank.
FD = Field Duplicate.

Table 2.6-2 Field QC Samples by Method for Septic Tank Samples, Sylvania Corning FUSRAP Site

Analytical Method	Matrix	Number of Primary Samples	Number of Field Duplicates	Frequency	Number of Trip Blanks	Number of Field Blanks
A-01-R	Soil/Sludge	21	2	10%	NA	0
GA-01-R	Soil/Sludge	19	2	10%	NA	0
SW6010B	Soil/Sludge	21	2	10%	NA	0
SW6020A	Sludge	7	0	10%	NA	0
SW7471	Soil/Sludge	21	2	10%	NA	0
SW8260B	Soil/Sludge	21	2	10%	1	0

Key:
NA = Not applicable.

2.6.1.1 Field Duplicates

Field duplicates were submitted blind to the laboratory, but the corresponding sample identifications are listed in the DUSR. Field duplicate results are summarized on Table 7 of the DUSR. Overall, field duplicate precision was good.

The field duplicate precision was outside acceptance criteria for several thorium and uranium isotopes analyzed by Method A-01-R and for potassium-40 and radium-228 analyzed by Method Ga-01-R; therefore, the results for the field dupli-

cate sample pairs STB-02-Z8 and STB-01-Z5 were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect.

PCE, chromium, and iron results in the field duplicate sample pair for sample STS-01-FA13 were qualified "J" as estimated due to poor precision.

2.6.1.2 Trip Blanks

Trip blanks were collected at a rate of one for every shipment containing VOCs. A trip blank was not provided in the coolers with samples for VOCs analysis for SDGs 16086841 or 16086431. 2-Butanone (MEK) and acetone were detected in trip blank TB04.

2.6.1.3 Rinsate Blanks

Rinsate samples were collected at a rate of one per 20 groundwater samples. The bulk of the sampling equipment was dedicated.

2.6.2 Laboratory Data Quality Evaluation

Data associated with laboratory and field QC samples that meet all acceptance limits were not qualified and are considered usable as reported. Data associated with laboratory and field QC samples that exceeded some of the acceptance limits or had other analytical problems are qualified as described in the DUSR in Appendix A and summarized in a separate section for each analytical method below.

Tables 3 through 7 in the DUSR provide a list of sample results qualified and the reason for data qualification.

2.6.2.1 Septic Tank Samples – Chemical Analysis

Method 8260

Acetone, PCE, and 1,2,3-trichlorobenzene were detected in method blanks. The result for acetone in trip blank TB-01-FA13 was "U" qualified as non-detect due to method blank detections.

Acetone results were "U" qualified in samples STS-B01-Z1 and STS-B01-Z2, and 2-butanone was "U" qualified in STS-B01-Z1 due to positive detections in the trip blank.

Due to matrix interferences, two or more surrogate recoveries were below control limits for samples STB-02-Z1, STS-02-FA13, and STS-03-FA13; the sample results were qualified "J" as estimated for detected results or "UJ" as estimated non-detect.

Acetone, methyl acetate, 1,4-dioxane, and 2-butanone exhibited relative response factors (RRF) less than the laboratory minimum in various analytical batches. The analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 (>0.0050 for 1,4-dioxane) is acceptable. No qualification of the data was made.

The internal standard recoveries were below control limits in samples STB-02-Z1, STS-B01-Z1, and STS-B01-Z2. The sample results were already qualified "J" as estimated for detected results or "UJ" as estimated non-detect for surrogate failures.

Dichlorodifluoromethane, 1,4-dioxane, chloromethane, trans-1,3-dichloropropene, trichlorofluoromethane, and 4-methyl-2-pentanone exhibited %D greater than control limits in several CCV/ICV. The analytes are poor performing compounds in a multi-parameter spike and EPA SOP HW-33 Rev3 allows up to 40% D for poor performers (up to 50% D for 1,4-dioxane). The associated sample results were non-detect and no qualification of data was made.

Several samples were analyzed at medium level due to target concentrations exceeding the calibration curve, resulting in elevated reporting limits, which may impact data comparability. Toluene was reported at elevated detection limits in sample STS-B01-Z2.

Method 6010

Several sample digestates were diluted due to high concentrations of target compounds, interfering analytes, and because they were noted to have a yellow color. Each sample reports several analytes at elevated reporting limits, which may affect comparability.

Several metals (selenium, calcium, iron, zinc) were detected in the method blanks associated with the samples.

Beryllium, cadmium, copper, lead, manganese, and vanadium were detected in the ICB and CCB. The following data were qualified: associated vanadium sample results were qualified with "U" as non-detect due to contamination in the CCB, two (2) samples were "U" qualified for zinc detection in the method blank, eighteen (18) samples were "U" qualified for lead detections in the ICB or CCB, and seven (7) samples were "U" qualified for copper detections in the CCB.

Potassium and sodium were recovered high in an LCS and CCV. The analytes were not detected in the associated samples. No qualification of the data was made.

Aluminum was qualified with "J" as estimated in the parent samples due to high recovery in the MS and MSD of samples STB-01-Z8 and STB-02-Z8. Several analytes were outside of acceptance criteria in the MS/MSD of STS-B01-Z1. The results were qualified "J" as estimated for detected results or "UJ" as estimated for non-detect results. Aluminum, barium, chromium, manganese, lead, nickel, and silver were "J" qualified in the parent sample STS-01-FA13 due to MS/MSD recoveries outside control limits.

Thallium was recovered high in a CRI. The analyte was not detected in the samples; therefore, no qualification of the data was made.

Method 7471B

MS/MSD recoveries were outside control limits for sample STS-01-FA13; the native sample concentration was greater than four times the spiking concentration and no qualification of the data was required.

2.6.2.2 Septic Tank Samples – Radiological Analysis

Method A-01-R (Isotopic Thorium and Uranium)

Thorium-228 and thorium-230 were detected above the MDC and 2-sigma uncertainty and below one-half the PQL in method blanks for thorium analysis by alpha spectroscopy. The normalized absolute difference test was applied per the USACE guidance for thorium-228 and thorium-230, and the sample results were qualified with "J" as estimated, as required.

Method Ga-01-R (Gamma Spectroscopy)

Radium-226 was detected in a method blank above the MDC or 2-sigma uncertainty and below the PQL. Associated sample results were qualified with "J" as estimated.

This page intentionally left blank.

3 Data Summaries

Tables summarizing the complete results for the site samples are provided in this section. Field duplicate results are presented along with the field samples. Table 7 in the DRMs (see Appendix A) reports the RPDs for the field duplicates.

Complete analytical results are provided in Appendix B.

The following sections provide data tables for each phase of fieldwork.

3.1 Vertical Profile Data Summaries

Tables 3.1-1 through 3.1-3 include the analytical results for Vertical Profile investigations conducted from September 2014 through March 2016.

3.2 Monitoring Well Data Summaries

Tables 3.2-1 through 3.2-3 include the analytical results for Monitoring Well sampling conducted in 2015 and 2016.

3.3 DR-Z Sludge Data Summary

Table 3.3-1 includes the analytical results for DR-Z sludge sampling conducted in 2015.

3.4 CSIA Data Summary

Table 3.4-1 includes the analytical results for CSIA sampling conducted in 2013.

3.5 Building 70 Waste Drain Investigation Data Summaries

Tables 3.5-1 through 3.5-3 include the analytical results for Building 70 Waste Drain sampling conducted in 2014.

3.6 Septic Tank Data Summaries

Tables 3.6-1 and 3.6-2 include complete analytical results for Septic Tank sampling conducted in 2013 and 2014.

This page intentionally left blank.

Table 3.1-3 Summary of Analytical Results for Groundwater Vertical Profile Samples
Sylvania FUSRAP Site, Hicksville, NY

Key:

Qualifiers

J = Estimated value

U = Not detected (method detection limit shown)

UJ = Not detected/estimated detection limit

Other

G = Guidance value (no standard available)

N/A = Not regulated/no available criteria

µg/L = Micrograms per liter

Notes:

1. Bold values denote positive hits.
2. VP900 and VP901 designate field duplicate samples.

Key at end of table.

Table 3.1-4 Summary of Analytical Results for Drill Water and Rinsate Samples
Sylvania FUSRAP Site, Hicksville, NY

Key:

Qualifiers

J = Estimated value

U = Not detected (method detection limit shown)

Other

G = Guidance value (no standard available)

N/A = Not regulated/no available criteria

µg/L = Micrograms per liter

Note:

Bold values denote positive hits.

Table 3.2-1 Summary of Analytical Results for Groundwater Samples
Sylvania FUSRAP Site, Hicksville, NY

Key:

Qualifiers

J = Estimated value

U = Not detected (method detection limit shown)

UJ = Not detected/estimated detection limit

UR = Not detected/result is rejected

Other

µg/L = Micrograms per liter

-- = Analyte not analyzed for

"-FD" denotes field duplicate sample

Bold values denote positive hits.

Exceeds groundwater standard.

Exceeds groundwater guidance value.

Notes:

Notes:

U - Either there was no peak corresponding to the target analyte or that such a peak did not produce a reliable CSIA result.

J - Target analyte producted a low peak signal and the result is considered usable to +/- 20‰, but not the standard +/- 5‰.

NA - Target analyte not analyzed.

Table 3.5-2 Summary of Analytical Results for Building 70 Waste Drain Soil Samples
Sylvania Corning FUSRAP Site, Hicksville, New York

Analyte	Sample Name:	Depth:	Date:

Key:

Qualifiers

J = Estimated value

J- = Estimated value with low bias

U = Not detected (method detection limit shown)

UJ = Not detected/estimated detection limit

UR = Not detected/result is rejected

Other

µg/kg = Micrograms per kilogram

mg/kg = Milligrams per kilogram

pCi/g = Picocuries per gram

-- = Analyte not analyzed for

"-FD" denotes field duplicate sample

Bold values denote positive hits.

Key:

Qualifiers

J = Estimated value

U = Not detected (method detection limit shown)

UJ = Not detected/estimated detection limit

Other

µg/kg = Micrograms per kilogram

mg/kg = Milligrams per kilogram

pCi/g = Picocuries per gram

-- = Analyte not analyzed for

"-FD" denotes field duplicate sample

Bold values denote positive hits.

4 System Audits

Audits are summarized in Table 4-1 and included in Appendix C.

Table 4-1 Summary of System Audits

Audit Dates	Company	Scope of Audit and Summary of Findings
03/31/2016	LBG	Quality Control Inspection during drilling/vertical profiling in 2016. Only minor deficiencies were noted none of which would affect the quality or interpretation of the data. For example, for quick turn-around samples, one corrective action was to have field managers send a picture of the chain-of-custody to the field team leader to review for accuracy and completeness prior to sending to lab.
04/12/2016	LBG	Field Audit during monitoring well sampling in 2016. The one minor deficiency noted was that one sampler was not wearing steel-toed boots or safety glasses.

This page intentionally left blank.

5 Data Completeness and QA/QC Problems

This section summarizes the degree to which the analytical systems met or failed the data quality objectives (DQOs) listed in the QAPP. A discussion is provided for each phase of fieldwork.

5.1 VP Data Completeness

5.1.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.1-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1 and below. Data points that were qualified as estimated are considered usable for the purposes of this project. A total of 100% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.1-1 Summary of Data Completeness for VP Samples

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	R	Total	Rejected
Groundwater	D5174	11	2	8		0	21	0%
	SW6010B	66	97	100	1	0	264	0%
	SW7470	4	1	7		0	12	0%
	SW8260B	22	17	584	1	0	624	0%
	SW8260C	350	266	10584	88	0	11288	0%
	Totals	**453**	**383**	**11283**	**90**	**0**	**12209**	**0%**

5.1.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Field duplicate sample precision for a minority of the analytes was not within QC acceptance criteria. Field duplicate sampling procedures do not appear to be a concern.

- Low levels of VOCs were commonly detected in drill water samples. TCE was detected in drill water, which initiated a work stoppage and investigation into the source of contamination. The memorandum Sylvania Corning FUSRAP – Drill Water TCE Summary dated October 7, 2014 (revised January 12, 2015) details the investigation of the source of TCE. The drill water contaminants did not affect data usability. Associated sample results were qualified as noted on the DRMs.

5.2 Groundwater Data Completeness

5.2.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.2-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.1. Data points that were qualified as estimated are considered usable for the purposes of this project. Results for 44 samples were rejected and 99.59% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.2-1 Summary of Data Completeness for MW Samples

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	UR	Total	Rejected
Water	A-01-R		1	9	2		12	0%
	D5174	60		66	1		127	0%
	SW6010	15	109	44			168	0%
	SW7470		1	1			2	0%
	SW8260B	401	444	9265	194	44	10348	0.43
	Totals	**476**	**555**	**9385**	**197**	**44**	**10657**	**0.41%**

5.2.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Sample results for bromoform, 1,3-dichlorobenzene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene were “UR” qualified as rejected non-detect due to internal standard failures in samples MW-206-470-SP15, MW-210-280-SP15, MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-210-280-SP15, and MW-210-380-SP15.
- Several samples were diluted for VOCs and metals analyses due to matrix effects and/or to bring analyte concentrations within the calibration range. Comparability may be affected.

- Internal standard responses for Method 8260 SIM were outside of QC limits; one sample result was qualified with "J" as estimated.

5.3 Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge Data Completeness

5.3.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.3-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.2. These data were not validated, but were verified and reviewed, as discussed in Section 1.2. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.3-1 Summary of Data Completeness for Concrete Asphalt Waste, Surface Soil, and DR-Z Sludge Samples

Sample Matrix	Lab Method ID	Not Qualified[1]	J[2]	U	UJ[3]	UR	Total	Rejected
Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge	A-01-R	32		4		0	36	0%
	GA-01-R	48		2		0	50	0%
	SW6010	43	58	24	7	0	132	0%
	SW7471	1	3	2		0	6	0%
	SW8081A			35	7	0	42	0%
	SW8082			30	5	0	35	0%
	SW8151A			9	3	0	12	0%
	SW8260B		1	58	1	0	60	0%
	SW8270D			60	12	0	72	0%
	SW9012			5	1	0	6	0%
	SW9034	1		5		0	6	0%
	SW9045D	6				0	6	0%
	SW9095B			5		0	5	0%
	Totals	**131**	**62**	**239**	**36**	**0**	**468**	**0%**

Notes:
1 Includes not qualified and D qualifiers.
2 Includes DJ and JD qualifiers
3 Includes UH, UHQ, and UQ qualifiers

5.3.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- There was insufficient sample volume to perform PCBs or paint filter liquids analyses on the DR-Z sludge sample.
- Several samples were diluted for metals analyses to bring analyte concentrations within the calibration range. Comparability may be affected.
- There was insufficient sample volume of DR-Z sludge to perform radium-226 by gamma spectroscopy using the preferred geometry, and the turnaround time did not allow for ingrowth, which caused spectral interference and an elevated MDC; therefore, the sample result should be considered to have a high bias.

5.4 CSIA Data Completeness

5.4.1 Data Completeness

The overall completeness of the data for this phase is summarized in "Verification of CSIA Data" in Appendix A. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.3. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the data are usable. The completeness goals for the project were met based on this percentage.

5.4.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected.

5.5 Building 70 Waste Drain Investigation Data Completeness

5.5.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.5-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.4. Data points that were qualified as estimated are considered usable for the purposes of this project. Results for 203 samples were rejected and 95.4% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.5-1 Summary of Data Completeness for Building 70 Waste Drain Investigation Samples

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	UR	Total	Rejected
Sludge, Soil, and Water	A-01-R	148	5	44	1		198	0%
	D5174	9		1			10	0%
	GA-01-R	181	2	49	2		234	0%
	SW6010	503	156	308	2	1	970	0.1%
	SW6020A	66	14	58	1		139	0.43
	SW7470	2	2	4			8	0%
	SW7471	16	7	3		6	32	19%
	SW8260B	1124	75	1198	238	196	2831	7%
	SW9315	1		4			5	0%
	SW9320	1		4			5	0%
	Totals	**2051**	**261**	**1673**	**244**	**203**	**4432**	**4.6%**

5.5.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Internal standards were outside control limits for several samples by Method 8260. The detected results for samples DRYH-H-SG1, DRYH-H-SG2, DRYH-H-SG3 (reanalysis), DRYH-H-SG1, DRYH-H-SG2, DRYH-I-SG1, and DRY-H-J-SG3 were qualified “J” as estimated and the non-detect results were qualified “UR” as rejected non-detect.
- The laboratory did not log in sample DRYH-G-Z8 for VOCs analysis; therefore, VOC results are not available for this sample.
- Thallium recovery was below control limits in the PDS and 0% for the MS/MSD; results were qualified with “UR” as rejected for sample DRYH-G-WEST-1.
- Several samples were re-extracted and analyzed outside of hold time for mercury by Method 7471 due to loss of data by the laboratory after a failure of instrument software; detected sample results were qualified with “J“ as estimated with a low bias and non-detects were qualified with “UR” and rejected.
- Several samples were diluted due to an oily, viscous matrix after digestion for metals analysis by Methods 6010 and 6020; elevated reporting limits were provided, which may impact data comparability.
- Six samples were analyzed at a medium level by Method 8260 due to high concentrations of target analytes and sample matrix effects; elevated reporting limits were reported, which may impact data comparability.

5.6 Septic Tank Data Completeness

5.6.1 Data Completeness

The overall completeness of the data for this phase is summarized on Table 5.6-1. All samples were collected and analyzed as planned, with the exceptions noted in Section 1.5. Data points that were qualified as estimated are considered usable for the purposes of this project. No sample results were rejected and 100% of the data are usable. The completeness goals for the project were met based on this percentage.

Table 5.6-1 Summary of Data Completeness for Septic Tank Samples

Sample Matrix	Lab Method ID	Not Qualified	J	U	UJ	UR	Total	Rejected
Soil and Sludge	A-01-R	148	26	47	1	0	222	0%
	A-01-R	143	4	45	4	0	196	0%
	D5174	262	211	283	14	0	770	0%
	SW6010	23	5	5	1	0	34	0%
	SW7470	11	1	23		0	35	0%
	SW8260B	902	68	1358	122	0	2450	0%
	Totals	**1489**	**315**	**1761**	**142**	**0**	**3707**	**0%**

5.6.2 QC Summary and Recommended Changes

Field Sampling Problems

No problems were noted with the sampling procedures.

Analytical Method Problems

No problems were noted with the analytical methods used for the samples collected except for:

- Overall, field duplicate precision was good. RPD acceptance criteria were exceeded for thorium and uranium isotopes analyzed by Method A-01-R, potassium-40 and radium-228 analyzed by Method Ga-01-R for field duplicate sample pairs STB-02-Z8 and STB-01-Z5, and PCE, chromium, and iron for field duplicate sample pair STS-01-FA13.
- Low levels of VOCs were detected in method blanks and one of the trip blanks by Method 8260; metals were detected in method and calibration blanks by Method 6010; thorium isotopes were detected in method blanks by Method A-01-R; and radium-226 was detected in a method blank by Method Ga-01-R.
- Surrogate recoveries were outside control limits for three samples by Method 8260; results in associated samples were qualified with “J” as estimated for detected results or “UJ” as estimated non-detect.

- Surrogate recoveries were outside control limits for several samples by Method 8260; results in associated samples were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect.
- Several samples were analyzed at a medium level by Method 8260 due to high concentrations of target analytes; elevated reporting limits were reported, which may impact data comparability.
- Several samples were diluted due to a yellow colored matrix after digestion, interfering analytes, and high concentrations of target compounds for metals analysis by Method 6010; elevated reporting limits were provided, which may impact data comparability.
- Recoveries for some of the metals were outside control limits by Method 6010 in several MS/MSDs.

Associated sample results were qualified as noted on the DUSRs.

This page intentionally left blank.

6 PARCC Summary

6.1 PARCC Parameters

Sampling and analysis were performed using methods and techniques designed to optimize and evaluate precision, accuracy, representativeness, completeness, and comparability (PARCC; the primary data quality indicators) in the data. Meeting PARCC objectives was optimized by following the work plans; using quality laboratories; and management oversight of the work. Instances of questionable QC performance were evaluated and the findings presented in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems. Additional details can be found in the DUSRs included in Appendix A. The PARCC parameters are defined as follows:

- **Precision.** Precision was evaluated through the use of field and analytical duplicate samples.
- **Accuracy.** Accuracy was evaluated through the use of analytical standards, QC samples such as spikes and LCSs, and blank samples.
- **Representativeness.** Representativeness of the data was evaluated through the use of field and analytical duplicate samples, and laboratory and field blanks.
- **Completeness.** The analytical completeness, i.e., the percentage of obtained measurements that are judged to be valid and usable (excludes data that are qualified with R or UR).
- **Comparability.** Comparability of the data was evaluated with field and analytical QC samples; the use of consistent contract-required detection limits and ensuring that the laboratories met them; and by management oversight, which determined that the work was performed consistently with previous techniques.

The following sections summarize the PARCC parameters and data usability for each sample event.

6.2 Data Usability

6.2.1 Vertical Profile Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail

in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). There were instances where poor precision was noted for some analytes for the field duplicates and the results were qualified with "J" as estimated, but there was no impact to data usability or potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits. The RPDs for some analytes for MS/MSDs were outside acceptance criteria; the associated detected sample results were qualified with "J" as estimated.

Accuracy was generally acceptable. Laboratory spike recoveries were typically within acceptance criteria and field and laboratory blanks exhibited minimal contamination. Low levels of VOCs and metals were detected in method blanks and in several rinsate blanks. Uranium was detected in one rinsate blank. The associated sample results were "U" qualified based on the level of blank contamination versus the amount present in the project sample. Surrogate recoveries and internal standard responses were generally acceptable. Several analyte recoveries were outside acceptance criteria in LCSs and MS/MSDs; associated sample results were qualified with "J" as estimated, "UJ" as estimated non-detect, or not qualified at all as discussed in Section 2.1.2.

Low levels of VOCs were commonly detected in drill water samples. TCE was detected in drill water, which initiated a work stoppage and investigation into the source of contamination. The memorandum Sylvania Corning FUSRAP – Drill Water TCE Summary dated October 7, 2014 (revised January 12, 2015) details the investigation of the source of TCE. The drill water contaminants did not affect data usability.

Laboratory control sample recoveries were generally good, with a few exceptions of LCS and MS/MSD recoveries outside control limits for a few VOCs and metals, which resulted in some of the associated sample results being qualified "J" as estimated or "UJ" and estimated non-detect. Calibration %D was exceeded for PCE for one analytical batch analyzed by Method SW8260. The detected analytes associated with the failures were qualified with "J" as estimated.

Several samples were diluted for VOCs and metals analyses due to matrix effects and/or to bring analyte concentrations within the calibration range. Representativeness and comparability may be affected.

Completeness of the results was acceptable as noted on Table 5.1-1. No sample results were rejected. The overall completeness of data was 100%.

6.2.2 Groundwater Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). Acetone results were qualified with "J" as estimated for the field duplicate sample pair for sample MW-225-330-SP16 due to poor precision, but there was no impact on data usability or potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits. Several calibration verification standards exhibited %D above acceptance criteria; therefore, the associated sample results were qualified with "J" as estimated or "UJ" as estimated non-detect.

Accuracy was generally acceptable. Laboratory spike recoveries were typically within acceptance criteria and field and laboratory blanks exhibited minimal contamination. Low levels of VOCs were detected in trip blanks and rinsate blanks. The associated sample results were "U" qualified based on the level of blank contamination versus the amount present in the project sample. Surrogate recoveries and internal standard responses were generally acceptable except Method 8260 SIM internal standard recoveries were outside acceptance criteria; therefore, one sample result was qualified with "J" as estimated. Surrogate recoveries were above control limits for several samples by Method 8260; therefore, detected compounds in associated samples were qualified with "J" as estimated. LCS recoveries were generally good. No qualifications were required for non-detected analytes in the associated samples with LCS recoveries that exceeded acceptance criteria. In several of the SDGs, the continuing calibration results exceeded the percent difference from the initial calibration. For several analytical batches by Method 8260, RRFs for poor performing and other analytes were below quality control limits. The analytes associated with the failures were qualified "J" if detected or "UJ" if non-detect. MS/MSD recoveries were above control limits for several VOCs and metals; therefore, detected results for associated samples were qualified with "J" as estimated and non-detects were not qualified.

Comparability of results was acceptable as most data was usable and valid. Serial dilution results for calcium for one batch were outside control limits; calcium results for two samples were qualified with "J" as estimated. Several samples were diluted for VOCs and metals analyses due to matrix effects and/or to bring analyte concentrations within the calibration range. Comparability may be affected.

Completeness of the results was acceptable as noted on Table 5.2-1. Most of the results were acceptable and valid for an overall completeness of data at 99.59%.

6.2.3 Concrete, Asphalt Waste, Surface Soil, and DR-Z Sludge Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and Representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits. Several calibration verification standards exhibited %D above acceptance criteria; therefore, the associated sample results were qualified with "J" as estimated or "UJ" as estimated non-detect.

Accuracy was generally acceptable. Laboratory spike (LCS/LCSD, MS/MSD, internal standard, and surrogate) recoveries were typically within acceptance criteria and field and laboratory blanks exhibited minimal contamination. There was insufficient sample volume of DR-Z sludge to perform radium-226 analysis by gamma spectroscopy using the preferred geometry and the turnaround time did not allow for ingrowth, which caused spectral interference and an elevated MDC; therefore, the sample result should be considered to have a high bias. For TCLP analysis by Method 8260, RRFs for poor performing and other analytes were below quality control limits; detected results for associated samples were qualified with "J" as estimated. The analytes associated with the failures were qualified "J" if detected or "UJ" if non-detect.

Comparability of results was acceptable as most data was usable and valid. Several samples were diluted for metals analyses to bring analyte concentrations within the calibration range. Comparability may be affected.

Completeness of the results was acceptable as noted on Table 5.3-1. There was insufficient sample volume to perform PCBs or paint filter liquids analyses on the DR-Z sludge sample, resulting in a completeness of data at 99.95%. All of the results for the analyses performed were acceptable and valid.

6.2.4 CSIA Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

The overall PARCC review of the data for this phase is summarized in "Verification of CSIA Data" in Appendix A.

Precision and representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits.

Accuracy was generally acceptable. Laboratory spike (LCS/LCSD, MS/MSD, internal standard, and surrogate) recoveries were typically within acceptance criteria and field and laboratory blanks exhibited minimal contamination.

Completeness of the results was acceptable. All of the results were acceptable and valid for an overall completeness of data at 100%.

6.2.5 Building 70 Waste Drain Investigation Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). RPD acceptance criteria were exceeded for potassium-40 and iron for the field duplicate sample pair for DRYH-G-Z6; for aluminum and copper for the field duplicate sample pair for DRY-E-B1-23-Z3; and for the uranium-238 results for the field duplicate sample pair for DRY H-H-L1. Results were qualified with “J” as estimated for detected results or “UJ” as estimated non-detect. There was no overall impact to data usability or potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits.

Accuracy was generally acceptable. Laboratory spike (LCS/LCSD, MS/MSD, internal standard, and surrogate) recoveries were typically within acceptance criteria and field and laboratory blanks exhibited minimal contamination. Several metals were detected in many of the method and calibration blanks at low levels by Method 6010. Uranium was detected in a method blank by Method ASTM D-5174, and thorium isotopes were detected in a method blank by Method A-01-R. Low levels of VOCs were detected in trip blanks and rinsate blanks and low levels of metals were detected in two rinsate blanks. The associated sample results were “U” qualified based on the level of blank contamination versus the amount present in the project sample. Surrogate recoveries and internal standard responses were generally acceptable except surrogate recoveries were outside control lim-

its for several samples by Method 8260; results in associated samples were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect. LCS recoveries were generally good. LCS and MS/MSD recoveries were outside control limits for a few VOCs; associated sample results were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect. Internal standards were outside control limits for several samples by Method 8260. The detected results for samples DRYH-H-SG1, DRYH-H-SG2, DRYH-H-SG3 (reanalysis), DRYH-H-SG1, DRYH-H-SG2, DRYH-I-SG1, and DRY-H-J-SG3 were qualified "J" as estimated and the non-detect results were qualified "UR" as rejected non-detect. Thallium recovery was below control limits in the PDS and 0% for the MS/MSD; therefore, results were qualified with "UR" as rejected for sample DRYH-G-WEST-1. Recoveries for some of the metals were outside control limits by Method 6010 in several MS/MSDs and PDSs and by Methods 6020 and A-01-R for MS/MSDs; detected results for associated samples were qualified with "J" as estimated

Comparability of results was acceptable as most data was usable and valid. Six samples were analyzed at a medium level by Method 8260 due to high concentrations of target analytes and sample matrix effects; elevated reporting limits were reported, which may impact data comparability. Several samples were diluted due to an oily, viscous matrix after digestion for metals analysis by Methods 6010 and 6020; elevated reporting limits were provided, which may impact data comparability. Several samples were re-extracted and analyzed outside of hold time for mercury by Method 7471 due to loss of data by the laboratory after a failure of instrument software; detected sample results were qualified with "J" as estimated with a low bias and non-detects were qualified with "UR" and rejected.

Completeness of the results was acceptable as noted on Table 5.5-1. The laboratory did not log in sample DRYH-G-Z8 for VOCs analysis; therefore, VOC results are not available for this sample, Most of the results were acceptable and valid for an overall completeness of data at 94.3%.

6.2.6 Septic Tank Sampling

All PARCC parameters met the objectives for usability except as noted below. Quality control results that did not meet PARCC objectives are discussed in detail in Section 2: Data Analysis and Validation and Section 5: Data Completeness and QA/QC Problems.

Precision and representativeness were generally acceptable. Field duplicates overall exhibited acceptable reproducibility and laboratory and field blanks were predominantly free of contamination that would impact sample results (see also accuracy discussion below). RPD acceptance criteria were exceeded for thorium and uranium isotopes analyzed by Method A-01-R and potassium-40 and radium-228 analyzed by Method Ga-01-R for field duplicate sample pairs STB-02-Z8 and STB-01-Z5; and for PCE, chromium, and iron for field duplicate sample pair STS-01-FA13. Results were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect. There was no overall impact to data usability or

potential concerns with the sampling methodology. The precision between MS and MSD and LCS and LCSD results was generally acceptable. The precision between calibration and verification standards and serial dilutions was usually within quality control limits.

Accuracy was generally acceptable. Laboratory spike (LCS/LCSD, MS/MSD, internal standard, and surrogate) recoveries were typically within acceptance criteria, and field and laboratory blanks exhibited minimal contamination. Low levels of VOCs were detected in method blanks and one of the trip blanks by Method 8260; metals were detected in method and calibration blanks by Method 6010; thorium isotopes were detected in method blanks by Method A-01-R; and radium-226 was detected in a method blank by Method Ga-01-R. The associated sample results were "U" qualified based on the level of blank contamination versus the amount present in the project sample. Surrogate recoveries and internal standard responses were generally acceptable except surrogate recoveries were outside control limits for three samples by Method 8260; results in associated samples were qualified with "J" as estimated for detected results or "UJ" as estimated non-detect. Overall, the LCS recoveries were generally good. Recoveries for some of the metals were outside control limits by Method 6010 in several MS/MSDs; therefore, detected results for associated samples were qualified with "J" as estimated

Comparability of results was acceptable as most data was usable and valid. Several samples were analyzed at a medium level by Method 8260 due to high concentrations of target analytes; elevated reporting limits were reported, which may impact data comparability. Several samples were diluted due to a yellow colored matrix after digestion, interfering analytes, and high concentrations of target compounds for metals analysis by Method 6010; elevated reporting limits were provided, which may impact data comparability.

Completeness of the results was acceptable as noted on Table 5.6-1. All of the results were acceptable and valid for an overall completeness of data at 100%.

Appendix A
Verification of CSIA Data

The isotopic data were not validated but were assessed for accuracy and precision before proceeding with the isotopic signature evaluation. VOC precision and sensitivity were assessed by reviewing field quality control samples: such as VOC Trip Blank, VOC Rinse Blank for soils, and field duplicates. (Note that these data sets did not have an external data indicator of accuracy.) The results of the data verification concluded that the data were not impacted by field sampling or handling techniques. The VOC Trip Blank and VOC Rinse Blank collected in August 2013 had non-detected concentrations for PCE and TCE. The field duplicate samples collected from 2009 to 2013 were compared to the parent samples to assess the sampling and laboratory precision (refer to Figure 1a and to Figure 1b). Field duplicates for TCE, PCE, and Total VOC provided reproducible results within 15 percent; note the regression lines in Figures 1A and 1B had slopes greater than 0.88 (with regression coefficients (R^2) greater than 0.97).

For the isotope results, the laboratory blank samples reported non-detected concentrations for the PCE and TCE isotopic ratios. The field duplicates for the isotopic data were also compared to parent samples; however, comparison was limited to three matched pairs. Figure 2 shows PCE isotopic carbon signature (δC13) and the isotopic chlorine signature (δCl37) between parents and duplicate samples relative to the 1:1 line. Similarly, Figure 3 shows TCE isotopic ratio of δC13 and δCl37 between the parent and duplicate samples. Duplicate samples showed a percent difference less than 16 percent (refer to Table 1 for values).

It should be noted that in addition to analyzing the isotopic ratio in the groundwater samples, Microseeps reported the TCE and PCE concentrations. These VOC data from Microseeps supplements the 2013 routine groundwater monitoring samples that were analyzed by Test America. As an independent check on accuracy, the TCE and PCE concentrations from samples analyzed by Microseeps and TestAmerica were compared (refer to Figure 4). The left panel of Figure 4 shows a scatter plot of TCE concentrations while the right panel shows a scatter plot of PCE concentrations. The TCE and PCE concentrations from both laboratories are comparable. For example, TCE concentrations for samples analyzed by Microseeps on average are approximately 13 percent higher than the samples analyzed by TestAmerica. The PCE concentrations from both laboratories are in closer agreement, with a regression line slope of 1.04 and a regression coefficient of 0.99.

The conclusion of the data verification is that the isotopic and VOC concentration data are not impacted by field sampling and handling. A review of the laboratory data packages confirms that the laboratory followed standard operating procedures and that the laboratory performance criteria were met.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. The sample year for RB01 and MW-401-SP16 on COC was 2015 and sample label year was 2016; 2016 date was used for login. TRIPBLANK-SP16 did not have a sample date on COC or label; shipped date was used for log in. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 395494.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct?	Yes.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes. The report and EDD for SDG 160-16944-1 were revised due to initial volume errors for Method 8260_SIM for 1, 4-dioxane for samples S-1-325-SP16 (160-16944-2), MW-220-325-SP16 (160-16944-16), and MW-215-395-SP16 (160-16944-17). Initial volume on instrument was incorrectly reported as 2 microliters instead of 5 milliliters, which caused the calculated results to be extremely (falsely) high; corrected results are reported herein.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone and chloroform were detected in the rinsate blank.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. The chloroform result for sample MWP-110-440-SP16 was qualified with a U for rinsate blank contamination.
Surrogate for method blanks and LCS within limits? *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes.
MS/MSD within QC criteria? See Table 3 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	Yes.
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.* See Table 6.	Yes. Several samples were diluted for analysis by SW8260B due to high concentrations of target analytes.
Do field duplicate results show good precision for all compounds? See Table 7	No. Acetone results were qualified with J as estimated for the field duplicate sample pair for sample MW-225-330-SP16 due to poor precision.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Yes.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. The following compounds (known as poor performers for Method 8260) did not meet the minimum relative response factor limits in the continuing calibration verification (CCV) associated with batches 246272 and 246258: Acetone, Methyl acetate, 2- Butanone, 4- Methyl-2- pentanone and 2- Hexanone. A low level CCV was analyzed at the reporting limit (1ug/L) and the affected analytes were detected for both batches. Target analytes detected above the reporting limit were qualified with J as estimated and analytes below the reporting limit were qualified with UJ as estimated.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Compliance Review Total Uranium by KPA Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	No.
Were any analytes flagged for blank contamination? See Table 2A. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Total Uranium by KPA Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.
Do field duplicate results show good precision for all isotopes? *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	Yes.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to confirm quenching; only one result is reported per sample.
Were background and continuing calibration checks performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check spectra and calculations; qualify per USACE guidance.*	No.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-16944 and 160-16967
Date Completed: 05 May 2016	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Summary of Potential Impacts on Data Usability
Major Concerns
Initial volume error for three samples for analysis of 1,4-dioxane by Method 8260_SIM caused results to be reported that were falsely extremely high. Upon request the laboratory reviewed the report and analyses, made the volume corrections, and issued a revised report and EDD; correct results are reported and discussed herein.
Minor Concerns
SW8260B: ● Sample result qualified for RB contamination ● Several sample results qualified for low response factors for poor performing compounds ● Elevated reporting limits provided for some analytes due to dilution required because of high concentrations of analytes. ● Compound qualified for field duplicate precision. SW6010B: ● Elevated reporting limit provided for nickel due to dilution required because of high concentration of salts.

Sample ID	Lab ID	Method	Sample Type	Action
MW-223-580-SP16	160-16967-1	SW8260B	WG	Sample diluted 5X for Trichloroethylene (TCE) concentration exceeding the calibration curve. Only TCE reported from dilution.
MW-219-560-SP16	160-16944-7	SW8260B	WG	Initial analysis run at 10X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 100X for Trichloroethylene (TCE) concentration exceeding the calibration curve. Only TCE reported from 100X dilution.
MW-220-325-SP16	160-16944-16	SW8260B	WG	Initial analysis run at 10X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 100X for Tetrachloroethylene (PCE) and Trichloroethylene (TCE) concentrations exceeding the calibration curve. Only PCE, and TCE reported from 100X dilution.
MW-58-75-SP16	160-16944-1	SW6010B	WG	Initial analysis run at 10X dilution due to sample matrix high salt content. Elevated reporting limits provided.
MW-222-340-SP16	160-16944-10	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for 1,2-Dichlorobenzene, Cis-1,2-Dichloroethylene, Tetrachloroethylene (PCE), and Trichloroethylene (TCE) concentrations exceeding the calibration curve. Only 1,2-Dichlorobenzene, Cis-1,2-Dichloroethylene, PCE, and TCE reported from 25X dilution.
MW-225-330-SP16	160-16944-15	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for Tetrachloroethylene (PCE) concentration exceeding the calibration curve. Only PCE reported from 25X dilution.
MW-401-SP16	160-16944-19	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for Tetrachloroethylene (PCE) concentration exceeding the calibration curve. Only PCE reported from 25X dilution.
MW-58-75-SP16	160-16944-1	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for Tetrachloroethylene (PCE) concentration exceeding the calibration curve. Only PCE reported from 25X dilution.
MWP-110-355-SP16	160-16944-8	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for Tetrachloroethylene (PCE) and Trichloroethylene (TCE) concentrations exceeding the calibration curve. Only PCE and TCE reported from 25X dilution.
MWP-110-440-SP16	160-16944-9	SW8260B	WG	Initial analysis run at 2.5X dilution. Elevated reporting limits provided for non-detect analytes. Diluted 25X for Tetrachloroethylene (PCE) concentration exceeding the calibration curve. Only PCE reported from 25X dilution.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	The COC was not included in the Laboratory Report. A revised report was issued that included the COC.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. The samples were received in good condition at a temperature of 1.3℃. There was no indication from the laboratory that the samples were frozen.
Frequency of Field QC Samples Correct?	A trip blank was included with the sample set. No other field QC was provided.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	A MS/MSD was not collected with the sample set. Insufficient sample volume was provided for the laboratory to perform a MS/MSD analysis for volatiles. A LCS/LCSD analysis was performed instead. A MS/MSD was performed for metals analysis.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2.	Yes. SW8260: 2-Butanone (MEK) and Acetone were detected in the trip blank (TB04). Acetone was detected in the method blank associated with medium level soil analysis. 1,2,3-Trichlorobenzene was detected in the method blank associated with the trip blank. SW6010: Lead was detected in the continuing calibration blank CCB 160-106765/12.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	SW8260: Acetone results were U qualified in samples STS-B01-Z1 and STS-B01-Z2, and 2-butanone was U qualified in STS-B01-Z1 due to positive detections in the trip blank.
Surrogate for method blanks and LCS within limits? See Table 3. -- *Organic Methods Only*	No. SW8260: The surrogate recoveries for Toluene-d8 and 4-Bromofluorobenzene were recovered high in the low level analysis of both soil samples. The analysis was repeated by the laboratory with similar results; therefore, matrix interference is likely present. The positive detections in the samples were qualified J as estimated.
Surrogate for samples and MS/MSD within limits? See Table 3. -- *Organic Methods Only* Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Insufficient sample volume was provided to perform a MS/MSD analysis for volatiles.
MS/MSD within QC criteria? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	SW8260B: Insufficient sample volume was provided to perform a MS/MSD analysis. SW6010: Several analytes were outside of acceptance criteria in the MS/MSD of STS-B01-Z1. The results were qualified J/UJ as estimated. The laboratory analyzed the batch PDS on sample STS-B01-Z2 instead of STS-B01-Z1. The recoveries were all greater than 30% and less than 200%; therefore qualification was made solely on matrix spike recovery.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5. *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. SW8260B: 1,2,3-trichlorobenzene was recovered high in LCS 160-101161/2-A for medium level analysis. The analyte was not reported for medium level samples. Chloroethane was recovered low in LCSD 160-11161/3 for medium level analysis, and also exhibited poor precision between the LCS and LCSD. The analyte was not reported for medium level samples
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. SW8260B: The samples were analyzed at medium level due to target concentrations exceeding the calibration curve. Toluene was reported at elevated detection limits in sample STS-B01-Z2. SW6010: The samples were diluted due to high concentrations of target compounds and interfering analytes. Elevated reporting limits provided.
Do field duplicate results show good precision for all compounds? See Table 7.	Field duplicate samples were not included with this SDG.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No. The internal standard 1,4-dichlorobenzene-d4 exhibited area counts less than the lower limit in samples STS-B01-Z1 and STS-B01-Z2 by low level. The low level sample results were qualified J/UJ as estimated. The positive detections were already J qualified as due to surrogate failures.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone (0.0695) and methyl acetate (0.0228) exhibited relative response factors (RRF) less than the laboratory minimum in batch 100341. Acetone (0.0369), methyl acetate (0.0164), 1,4-dioxane (0.0010) and 2-butanone (0.0604) exhibited relative response factors (RRF) less than the laboratory minimum in batch 103615. The analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 (>0.0050 for 1,4-dioxane) is acceptable. No qualification of the data was made
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	1,4-Dioxane exhibited a %D of 22.7% in ICV 160-103615/9. EPA SOP USEPA-540-R-08-01 allows up to 50% D for 1,4-dioxane; therefore, no qualification of the data was made.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. Dichlorodifluoromethane exhibited a %D of 54.5%, 1,4-dioxane exhibited a %D of 20.7%, and trichlorofluoromethane exhibited a %D of 20.2% in CCV 160-101222/3. EPA SOP USEPA-540-R-08-01 allows up to 40% D for these poor performing compounds. The CCV is associated with medium level analysis and the analytes were not reported. No qualification of data required.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone (0.0751) and methyl acetate (0.0240) exhibited relative response factors (RRF) less than the laboratory minimum in batch CCV 160-101222/3. Acetone (0.0360) and methyl acetate (0.0188) exhibited relative response factors (RRF) less than the laboratory minimum in batch CCV 160-103774/3. The analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
CVAA	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	No. Thallium was recovered high in CRI 160-102838/7. The analyte was not detected in the samples; therefore, no qualification of the data was made.
ICP	ICB/CCB detections <2X MDL?	Yes.

Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	Yes. A-01-R: Thorium-228 and Thorium-230 were detected above the MDC and 2-sigma uncertainty and below ½ the PQL in the method blank for thorium analysis by alpha spectroscopy.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No. A-01-R: The NAD test was applied per the USACE guidance for Thorium-228 and Thorium-230 for both samples and no qualification of the sample results was required.
LCS within QC criteria (70-130% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.

Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision for all isotopes? See Table 7. *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	N/A. No field duplicate was included with this SDG.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were background and continuing calibration checks performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check spectra and calculations; qualify per USACE guidance.*	No.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
Gamma Spec	Was the soil matrix density comparable to the calibration standard density? (70-130%) *If not comparable, qualify results with J.*	Yes. Sample densities were 107% and 103% of the calibration standard density.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
Gamma Spec	Were the samples prepared in sealed containers and subjected to a 21-day ingrowth period prior to analysis? *If not, qualify results with J.*	Yes. Ingrowth was from 1/29 to 2/19/14.
Alpha Spec	Were background and continuing calibration checks (pulsers) performed daily?	Yes. Pulsers were acceptable.
Alpha Spec	Were tracer yields within limits (QAPP: 50-100%, lab 30-110%)? *If recoveries were outside laboratory derived limits, but within default limits of 20-150%, flag associated results as estimated (J) after corrective actions; otherwise R. If recoveries are <20%: flag as rejected (R) and >150% rejected (R).*	Yes.
Alpha Spec	If recoveries were outside control limits, were adequate quantities of tracers used and were calculations correct? *Evaluate entire SDG for systematic errors and qualify if needed*	Yes. All tracer recoveries were within limits.
Alpha Spec	MS/MSD within QC criteria for Alpha Spectroscopy (70-130% recovery, RPD ± 35)? *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	N/A. MS/MSD are optional for alpha spec and were not performed for this SDG.

Summary of Potential Impacts on Data Usability
SW8260 • Acetone and 2-butanone are common laboratory contaminants and were U qualified as non-detect in the samples due to positive trip blank detections. • Surrogates toluene and 4-Bromofluorobenzene were recovered high in the soil samples. The positive detections were qualified J as estimated. • The internal standard 1,4-dichlorobenzene was less than 50% of the area response of the initial calibration in both soil samples. The positive detections were already J qualified due to surrogate failures. The non-detect results were qualified UJ as estimated. SW6010 • Sample results were qualified J/UJ in the STS-B01-Z1 due to matrix spike recoveries outside of control limits.

Table 6 –Samples that were Re-analyzed

Sample ID	Lab ID	Method	Sample Type	Action
STS-B01-Z1	160-5300-1	SW6010A	SO	Sample diluted by 10X due to high concentrations of target and interfering analytes. Elevated reporting limits provided.
STS-B01-Z2	160-5300-2	SW6010A	SO	Sample diluted by 10X due to high concentrations of target and interfering analytes. Elevated reporting limits provided.
STS-B01-Z1	160-5300-1	SW8260B	SO	Samples analyzed at medium level due to target analytes exceeding the calibration curve. Only the exceeding analytes are reported at medium level.
STS-B01-Z2	160-5300-2	SW8260B	SO	Samples analyzed at medium level due to target analytes exceeding the calibration curve. Toluene was reported with elevated reporting limits.

Table 7 – Summary of Field Duplicate Results

None.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-5300-1
Date Completed: 22 October 2015	Data Validation Chemist: J. Z. Christopher; Lynne Parker
Date Performed:	Data Validation Review:

Key:

AP	=	Acid Phenol
BN	=	Base Neutral
CCV	=	Continuing calibration verification
COC	=	Chain-of-custody
CVAA	=	Cold Vapor Automatic Absorption
GC	=	Gas Chromatography
GC/MS	=	Gas Chromatography/Mass Spectrometry
ICP	=	Inductively Coupled Plasma Argon Spectrometry
ICS	=	Interference check standard
ICV	=	Initial calibration verification
NA	=	Not Applicable
LCS	=	Laboratory Control Sample
MS/MSD	=	Matrix Spike/Matrix Spike Duplicate
QAPP	=	Quality Assurance Project Plan
QC	=	Quality Control
SD	=	Serial Dilution
SVOCs	=	Semivolatile Organic Compounds
TIC	=	Tentatively Identified Compound
VOCs	=	Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10950
Date Completed: 09 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369370.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes. Note: The samples designated for metals and KPA analyses do not require temperature preservation and were shipped in a separate cooler without ice (this cooler was 19.0 deg. C upon receipt).
Frequency of Field QC Samples Correct?	Yes.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10950
Date Completed: 09 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. SW8260B: 2-Butanone (MEK) and Acetone were detected in Trip Blank 01, Trip Blank 02, and Trip Blank 03.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. SW8260B: Results for 2-butanone, and acetone were U qualified as non-detect in several samples due to positive detections in Trip Blanks 01, 02, and 03. If the sample result was less than the PQL, the MDL was elevated to the sample result; however, if the sample result was greater than the PQL, then the PQL was elevated to the sample result.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	No. SW8260B: Recoveries for 4-Bromofluorobenzene and Toluene-d8 were above criteria for MB 160-180337/8. Detected results in the batch were qualified with J as estimated; see below and Table 3.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. SW8260B: Recoveries for 4-Bromofluorobenzene and Toluene-d8 were above criteria for samples in batch 180337; detected analytes for samples were qualified with a J as estimated.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No. SW8260B: Recovery for 1,2-Dibromoethane (EDB) was above criteria for the MS for sample MW-49S-SP15; however, the MSD and RPD were within criteria and EDB was not detected in the parent sample; therefore no qualifiers were added.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10950
Date Completed: 09 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. SW8260B: Samples MW-203-160-SP15, MW-203-360-SP15, MW-22S-SP15, MW-24S-SP15, MW-28S-SP15, MW-29S-SP15, and MW-39S-SP15 were diluted due to high concentrations of analytes. Elevated reporting limits are provided as applicable. Only one result is reported per analyte per sample.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10950
Date Completed: 09 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were added.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0248), methyl acetate(0.0141), 2-butanone(0.0302), 4-Methyl-2-pentanone (MIBK) (0.0939) and 2-hexanone(0.0651), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10950
Date Completed: 09 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. Dichlorodifluoromethane(24.3) exceeded the % D in CCV 160-179421/13. Dichlorodifluoromethane is a poor performer; therefore, per EPA SOP USEPA-540-R-08-01, a % D <40% is acceptable. No qualification of the data was made.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0250), methyl acetate(0.0154), 2-butanone(0.0286), and 2-hexanone(0.0617), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
SW8260B • Elevated reporting limits provided for several sample results due to dilution. • 2-Butanone and acetone were U qualified as non-detect in several samples due to positive detections in Trip Blank 01, Trip Blank 02, and Trip Blank 03. • High surrogate recoveries in Batch 180337 method blank and samples caused detected results to be qualified with J as estimated.

Table 4 – List of MS/MSD Recoveries and RPDs outside Control Limits

Method	Sample ID	Sample Type	Analyte	Orig. Result	Spike Amount	MS	MSD	Dil. Fac.	Low Limit	High Limit	Sample Qualifier
SW8260B	MW-49S-SP15	MS/MSD	1,2-Dibromoethane (EDB)	0.13	10.0	124	118	1	80	120	None

Table 5 - List of LCS Recoveries outside Control Limits

None.

Table 6 –Samples that were Re-analyzed

Sample ID	Lab ID	Method	Sample Type	Action
MW-203-160-SP15	160-10950-37	SW8260B	WG	Sample was initially analyzed at 1X dilution. The sample was diluted by 2X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-203-360-SP15	160-10950-38	SW8260B	WG	Sample was initially analyzed at 1X dilution. The sample was diluted by 10X to bring Trichloroethene (TCE) within the calibration curve. Only TCE is reported from the dilution.
MW-22S-SP15	160-10950-14	SW8260B	WG	Sample was initially analyzed at 100X dilution to bring Trichloroethene (TCE) within the calibration curve. Elevated reporting limits provided (except for 1,4-dioxane, which was analyzed at a 1X dilution).
MW-22S-SP15	160-10950-14	SW8260B	WG	Sample was initially analyzed at 100X dilution. The sample was diluted by 1000X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-24S-SP15	160-10950-34	SW8260B	WG	Sample was initially analyzed at 5X dilution to bring Trichloroethene (TCE) within the calibration curve. Elevated reporting limits provided (except for 1,4-dioxane, which was analyzed at a 1X dilution).
MW-24S-SP15	160-10950-34	SW8260B	WG	Sample was initially analyzed at 5X dilution. The sample was diluted by 25X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.

Sample ID	Lab ID	Method	Sample Type	Action
MW-28S-SP15	160-10950-22	SW8260B	WG	Sample was initially analyzed at 1X dilution. The sample was diluted by 10X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-29S-SP15	160-10950-23	SW8260B	WG	Sample was initially analyzed at 1X dilution. The sample was diluted by 10X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-39S-SP15	160-10950-27	SW8260B	WG	Sample was initially analyzed at 10X dilution to bring 1,1,1-Trichloroethane and Trichloroethene (TCE) within the calibration curve. Elevated reporting limits provided (except for 1,4-dioxane, which was analyzed at a 1X dilution).
MW-39S-SP15	160-10950-27	SW8260B	WG	Sample was initially analyzed at 10X dilution. The sample was diluted by 100X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-22S-SP15	369370014 (160-10950-14)	D5174	WG	Sample diluted 100X due to high total uranium concentration.
MW-24S-SP15	369370034 (160-10950-34)	D5174	WG	Sample diluted 1,000X due to high total uranium concentration.
MW-28D-SP15	369370020 (160-10950-20)	D5174	WG	Sample diluted 10X due to sample quenching.
MW-50I-SP15	369370028 (160-10950-28)	D5174	WG	Sample diluted 10X due to high total uranium concentration.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10990
Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. Sample MW-905-SP15 was sent with the sample set, but not included on the COC. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369359.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	The cooler temperatures were noted at 1.4°C and 1.7°C at receipt. The samples were noted to be received in good condition and not frozen.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was collected for the samples MW-20S-SP15. Samples MW-25S-SP15 and MW-208-540-SP15 were used for laboratory QC. One field duplicate was collected: MW-55S-SP15 (MW-905-SP15). Sample MW-55S-SP15 was included in SDG 160-11013-1. A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10990
Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone and 2-butanone were detected in Trip Blank 04 and Trip Blank 05.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Acetone was U qualified in the following samples due to trip blank detections: MW-202-495-SP15, MW-208-350-SP15, MW-208-540-SP15, MW-26S-SP15, and MW-905-SP15.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	No. The surrogate recoveries of toluene-d8 and p-bromofluorobenzene were above the upper control limit in MB 160-180642/8. No qualification of the data was made.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. The recovery of p-bromofluorobenzene was above the upper control limit in the following samples: MW-14D-SP15, MW-18S-SP15, MW-20I-SP15, MW-20S-SP15, MW-25S-SP15, and MW-41S-SP15. The recovery of toluene-d8 was above the upper control limit in the following sample: MW-202-380-SP15. Analyte detections in the samples were J qualified as estimated. No qualification was made on non-detect results. The samples were not reanalyzed and there was no evidence of matrix effects from the chromatograms.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. Cyclohexane was recovered high in the MS/MSD of MW-20S-SP15. The associated LCSD was non-compliant. Cyclohexane is a poor performer per EPA SOP USEPA-540-R-08-01. The results were non-detect in the parent sample; therefore, no qualification of the data was made.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10990
Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. Cyclohexane was recovered high in LCSD 160-180642. The analyte is a poor performer per EPA SOP USEPA-540-R-08-01. The results were non-detect in the associated samples; therefore, no qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. MW-202-380-SP15 was initially analyzed at a dilution. Elevated reporting limits are provided. The following samples were diluted due to target analytes exceeding the calibration curve: MW-43S-SP15, MW-208-350, and MW-202-380-SP15. Only the target analytes were reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	Yes. Uranium was detected in a method blank above the PQL; however, the sample results were all greater than ten times the blank concentration; no results were qualified.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10990
Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	No. MS/MSD recoveries were above criteria for sample MW-20S-SP15; however, the sample concentration was more than five times the spike amount; therefore, no qualifiers were required.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a dilution and/or post-spike to check for quenching; only one result is reported per sample. Several samples with low uranium concentrations were reprepped and reanalyzed due to method blank contamination in the initial batch. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0241), methyl acetate(0.0151), 2-butanone(0.0327), 2-hexanone(0.0643), and 4-methyl-2-pentanone(0.0947) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSZ. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0246), methyl acetate(0.0160), 2-butanone(0.0324), 2-hexanone(0.0651) and 4-methyl-2-pentanone(0.0969) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-180642/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. Acetone(0.0240), methyl acetate(0.0150), 2-butanone(0.0307), 2-hexanone(0.0603) and 4-methyl-2-pentanone(0.0934) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-181005/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2918) was less than the laboratory minimum of 0.300 in CCV 160-181005/4; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability

Major Concerns

None.

Minor Concerns

- Elevated reporting limits provided for sample MW-202-380SP15 due to initial analysis at a dilution.
- Positive detections in the following samples were J qualified as estimated due to elevated surrogate recoveries: MW-14D-SP15, MW-18S-SP15, MW-20I-SP15, MW-20S-SP15, MW-25S-SP15, MW-41S-SP15, and MW-202-350-SP15.
- Sample results for acetone was U qualified as non-detect in samples MW-202-495-SP15, MW-208-350-SP15, MW-208-540-SP15, MW-26S-SP15, and MW-905-SP15 due to trip blank detections.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-10990
Date Completed: 06 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Sample ID	Lab ID	Method	Sample Type	Action
MW-43S-SP15	160-10990-13	SW8260B	WG	The sample was diluted by 10X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
MW-202-380-SP15	160-10990-15	SW8260B	WG	Sample was initially analyzed at 5X dilution. Elevated reporting limits provided. The sample was diluted by 50X to bring Trichloroethylene (TCE) within the calibration curve. Only TCE is reported from the dilution.
MW-208-350-SP15	160-10990-19	SW8260B	WG	The sample was diluted by 10X to bring Tetrachloroethylene (PCE) and Trichloroethylene (TCE) within the calibration curve. Only PCE and TCE are reported from the dilution.

Table 7 – Summary of Field Duplicate Results

Method	Analyte	Unit	Matrix	PQL	Anal Type	MW-55SD-SP15 (SDG 160-11013)	MW-905-SP15	RPD	RPD Rating	Sample Qual
D5174	Uranium, Total	ug/l	Water	0.100	A	ND	ND	NC	--	--
SW6010B	Nickel	ug/l	WG	40	A	2.9	2.8	3.5%	Good	None
SW8260B	CHLOROFORM	ug/l	WG	1.0	A	2.2	2.2	0.0%	Good	None

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard

ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11013
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369649.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. One cooler was noted to be received at 18.0°C. The field team separated the samples into coolers for VOA and Metals analysis. The samples for Ni and U analysis were not shipped with ice, which is acceptable. The cooler with samples for VOC analysis was shipped on ice and received at 1.6°C. The samples were noted to be received in good condition and not frozen.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was not collected for the sample delivery group. Samples MW-52D-SP15, MW-55S-SP15, and MW-907-SP15 were used for laboratory QC. Two field duplicates were collected: MW-207-170-SP15 (MW-906-SP15) and MW-335-SP15 (MW-907-SP15). A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11013
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone and 2-butanone were detected in Trip Blank 07.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Acetone was U qualified as non-detect in MW-207-170-SP15, and 2-butanone was U qualified in MW-52D-SP15.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered high in the MS/MSD of MW-55S-SP15. The associated LCS recovery was non-compliant. The results were already qualified UJ for calibration failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11013
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the LCS associated with batch 181486/6. The sample results were non-detect, and qualified UJ due to calibration failures.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples MW-53S-SP15, MW-907-SP15, MW-207-170=SP15, MW-906-SP15, W-19-150-SP15, and MW-33S-SP15 were initially analyzed at a dilution. Elevated reporting limits are provided. The following samples were diluted due to target analytes exceeding the calibration curve: MW-33D-SP15, MW-52D-SP15, W-20-160-SP15, MW-53S-SP15, MW-907-SP15, MW-207-170=SP15, MW-906-SP15, W-19-150-SP15, and MW-33S-SP15. Only the target analytes were reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11013
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a dilution and/or post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11013
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0221), methyl acetate(0.0137), 2-butanone(0.0328), and 2-hexanone(0.0700), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2331) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	No. Dichlorodifluoromethane exhibited a %D of 41.7% for ICV 160-181014/6. This exceeds the EPA SOP USEPA-540-R-08-01 criteria of 40% for a poor performer. The associated results were non-detect; therefore, they were qualified UJ as estimated non-detect.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a %D of 28.6% in CCV 160-181486/5. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect. 1,1,2,2-tetrachloroethane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene exhibited a %D's of 36.2%, 23.8%, and 27.0% respectively in CCV 160-181945/5. EPA SOP USEPA-540-R-08-01 allows %D up to 25%; therefore, the associated results for 1,1,2,2-tetrachloroethane and 1,2,3-trichlorobenzene were qualified UJ as estimated non-detect.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0239), methyl acetate(0.0128), 2-butanone(0.0290), 2-hexanone(0.0634) and 4-methyl-2-pentanone(0.0957) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-181486/5. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. Acetone(0.0244), methyl acetate(0.0146), 2-butanone(0.0315), 2-hexanone(0.0637) and 4-methyl-2-pentanone(0.0994) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-181945/5. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
• Sample results for 1,1,2,2-tetrachloroethane, 1,2,3-trichlorobenzene, and dichlorodifluoromethane were UJ qualified due to calibration failures. • Elevated reporting limits provided for samples MW-53S-SP15, MW-907-SP15, MW-207-170=SP15, MW-906-SP15, W-19-150-SP15, and MW-33S-SP15 due to initial analysis at a dilution.

Date Performed:	Data Validation Review:

BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11036
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369673.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	The cooler temperature was 0.8°C at receipt. The samples were noted to be received in good condition and not frozen.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was collected for the samples W-24-260-SP15 and W-17-130-SP15. One field duplicate was collected: MW-12-SP15 (MW-908-SP15). A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11036
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. 2-Butanone, acetone, and carbon disulfide were detected in Trip Blank 08.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Sample results for acetone and carbon disulfide were U qualified as non-detect in sample W-25-150-SP15.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. Dibromofluoromethane was recovered high in the dilution analysis of MW-12-SP15; therefore the sample results for PCE were qualified J as e Dibromofluoromethane was recovered high in the analysis of W-24-260-SP15; therefore the positive sample detections were qualified J as estimated.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered high in the MS/MSD of W-17-130-SP15 and W-24-260-SP15. The results were already qualified UJ for calibration failures. Trans-1,3-dichloropropene was recovered high in the MS/MSD of W-17-130-SP15. The results were non-detect; therefore, no qualification of the data was made.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11036
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the LCS and LCSD's associated with batches 182094. The sample results were non-detect, and qualified UJ due to calibration failures. Methyl acetate was recovered high in the LCS associated with batch 182094. The analyte is a poor performer and not detected in the samples. No qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples W-14-130-SP15, MW-908-SP15, and MW-12-SP15 were initially analyzed at a dilution. Elevated reporting limits are provided. The following samples were diluted due to target analytes exceeding the calibration curve: MW-44S-SP15, W-23-110-SP15, W-14-130-SP15, MW-908-SP15, and MW-12-SP15. Only the target analytes were reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11036
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a dilution and/or post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0221), methyl acetate(0.0137), 2-butanone(0.0328), and 2-hexanone(0.0700), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2331) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSZ. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSZ; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	No. Dichlorodifluoromethane exhibited a %D of 41.7% for ICV 160-181014/6. This exceeds the EPA SOP USEPA-540-R-08-01 criteria of 40% for a poor performer. The associated results were non-detect; therefore, they were qualified UJ as estimated non-detect.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11036
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene exhibited a %D's of 36.2%, 23.8%, and 27.0% respectively in CCV 160-181945/5. EPA SOP USEPA-540-R-08-01 allows %D up to 25%; therefore, the associated results for 1,1,2,2-tetrachloroethane and 1,2,3-trichlorobenzene were qualified UJ as estimated non-detect. 1,1,2,2-tetrachloroethane exhibited a %D of 65.3% in CCV 160-182094/4. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect. Cyclohexane exhibited a %D of 23.1% in CCV 160-182094/4. Per EPA SOP USEPA-540-R-08-01 a %D up to 25% is acceptable. No qualification of the data was made.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0244), methyl acetate(0.0146), 2-butanone(0.0315), 2-hexanone(0.0637) and 4-methyl-2-pentanone(0.0994) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-181945/5. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. Acetone(0.0241), methyl acetate(0.0152), 2-butanone(0.0329), 2-hexanone(0.0680) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182094/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
• Sample results for 1,1,2,2-tetrachloroethane, 1,2,3-trichlorobenzene and dichlorodifluoromethane were UJ qualified due to calibration failures. • Elevated reporting limits provided for samples W-14-130-SP15, MW-908-SP15, and MW-12-SP15 due to initial analysis at a dilution. • Sample results for acetone and carbon disulfide were U qualified as non-detect in sample W-25-150-SP15. • Positive detections in samples MW-12-SP15 and W-24-260-SP15 were J qualified as estimated due to high recoveries of the surrogate dibromofluoromethane.

SW8260B	Tetrachloroethylene (PCE)	ug/L	WG	25	A	610	660	7.9%	Good	None
SW8260B	TRICHLOROETHYLENE (TCE)	ug/L	WG	2.5	A	2.9	2.7	7.1%	Good	None

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11068
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369742.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	The cooler temperature was 1.8°C at receipt. The samples were noted to be received in good condition and not frozen.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was not collected for the sample delivery group. Samples W-03-112-SP15 and W-26-270-SP15 were used for laboratory QC. Three field duplicates were collected: W-37-385-SP15 (MW-909-SP15), W-18-150-SP15 (MW-910-SP15), and W-06-79-SP15 (MW-911-SP15). A trip blank was provided in each cooler with samples for VOC analysis. A rinsate blank was included in the sample delivery group.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11068
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. 2-Butanone and acetone were detected in the Trip Blank 09 and rinsate blank RB01-SP15.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. 2-Butanone and acetone were U qualified as non-detect in the rinsate blank RB01-SP15. Acetone was U qualified as non-detect in MW-910-SP15, W-14-150-SP15, and W-31-95-SP15 due to trip blank detections.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSD of W-26-270-SP15. The LCS/LCSD for the analyte was also non-compliant. The sample results for the analyte were UJ qualified for CCV failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11068
Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits LCS and LCSD's associated with batches 182094 and 182182. The sample results were non-detect, and qualified UJ due to CCV failures. Methyl acetate was recovered high in the LCS associated with batch 182094. The analyte is a poor performer and not detected in the samples. No qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples W-16-148-SP15 and W-37-325-SP15, analyzed initially at a dilution. Elevated reporting limits are provided. The following samples were diluted due to target analytes exceeding the calibration curve: W-18-150-SP15, W-37-385-SP15, MW-909-SP15, MW-910-SP15, W-01-75-SP15, W-16-148-SP15 and W-37-325-SP15. Only the target analytes were reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Date Completed: 05 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0257), methyl acetate(0.0131), 2-butanone(0.0320), and 2-hexanone(0.0674), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.1689) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSZ. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSZ; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 59.5% in ICV 160-182107/14. The sample results were qualified UJ due to CCV failures.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a %D of 41.1% in CCV 160-182182/5 and a %D of 65.3% in CCV 160-182094/4. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect. Cyclohexane exhibited a %D of 23.1% in CCV 160-182094/4. Per EPA SOP USEPA-540-R-08-01 a %D up to 25% is acceptable. No qualification of the data was made.

Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0240), methyl acetate(0.0141), 2-butanone(0.0322), and 2-hexanone(0.0678) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182182/5. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2404) was less than the laboratory minimum of 0.300 CCV 160-182182/5; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0241), methyl acetate(0.0152), 2-butanone(0.0329), 2-hexanone(0.0680) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182094/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
• Sample results for 1,1,2,2-tetrachloroethane were UJ qualified due to CCV failures. • Elevated reporting limits provided for samples W-16-148-SP15 and W-37-325-SP15 due to

Summary of Potential Impacts on Data Usability

initial analysis at a dilution.

- Sample results for acetone were U qualified as non-detect in samples MW-910-SP15, W-14-150-SP18, and W-31-95-SP15.

- Sample results for 2-butanone and 2-hexanone were U qualified as non-detect in the rinsate blank RB01-SP15. Similar detections for the analytes were in both the trip blank and rinsate blanks. They were likely contaminants present in the water source that was used for both sample preparations.

Table 6 –Samples that were Re-analyzed

Sample ID	Lab ID	Method	Sample Type	Action
W-16-148-SP15	160-11068-5	SW8260B	WG	Sample was initially analyzed at 10X dilution. Elevated reporting limits provided. The sample was diluted by 100X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
W-18-150-SP15	160-11068-6	SW8260B	WG	The sample was diluted by 5X to bring Tetrachloroethylene (PCE) and cis-1,2-dichloroethylene within the calibration curve. Only PCE and cis-1,2-DCE are reported from the dilution.
W-37-325-SP15	160-11068-10	SW8260B	WG	Sample was initially analyzed at 2.5X dilution. Elevated reporting limits provided. The sample was diluted by 25X to bring Tetrachloroethylene (PCE), cis-1,2-dichloroethylene, and chloroform within the calibration curve. Only the exceeding analytes are reported from the dilution.
W-37-385-SP15	160-11068-11	SW8260B	WG	The sample was diluted by 10X to bring Tetrachloroethylene (PCE), trichloroethylene (TCE), chloroform, and 1,1-dichloroethene within the calibration curve. Only the exceeding analytes are reported from the dilution.
MW-909-SP15	160-11068-12	SW8260B	WG	The sample was diluted by 10X to bring Tetrachloroethylene (PCE), trichloroethylene (TCE), chloroform, and 1,1-dichloroethene within the calibration curve. Only the exceeding analytes are reported from the dilution.
MW-910-SP15	160-11068-13	SW8260B	WG	The sample was diluted by 5X to bring Tetrachloroethylene (PCE) and cis-1,2-dichloroethylene within the calibration curve. Only PCE and cis-1,2-DCE are reported from the dilution.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution

SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11082
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. One of the container labels did not match the sample name on the COC. The sample was logged in per the COC. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369745.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. One cooler was noted to be received at 19.0°C. The field team separated the samples into coolers for VOA and Metals analysis. The samples for Ni and U analysis were not shipped with ice, which is acceptable. The cooler with samples for VOC analysis was shipped on ice and received at 2.1°C.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was collected for sample W-08-71-SP15. Two field duplicates were collected; samples PW-02-06-SP15 (MW-912-SP15) and MW-201-220-SP15 (MW-913-SP15). A trip blank was provided in each cooler with samples for VOC analysis. A rinsate blank was performed and included with the sample delivery group.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Completeness Review - General Sample and Batch Information - See Attachment	
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone and 2-butanone were detected in Trip blank 10 and rinsate blank RB02-SP15.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Acetone and 2-butanone results were U qualified as non-detect in the rinsate blank RB02-SP15. Acetone was U qualified as non-detect in sample PW-02-06-SP15 due to trip blank detections.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. Dibromofluoromethane was recovered high in sample MW-3-SP15. Tetrachloroethylene (PCE) TRICHLOROETHYLENE (TCE) were detected in the sample and qualified J as estimated. The sample was not re-analyzed and there were no indications of matrix effects from the chromatogram.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11082
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSD of MW-912-SP15 and W-08-71-SP15. The LCS/LCSD for the analyte was also non-compliant. The sample results for the analyte were UJ qualified for CCV failures. Cyclohexane was recovered high in the MS/MSD of MW-08-71-SP15. The analytes is a poor performer and was not detected in the parent sample. No qualification of the data was made. 2-Butanone exhibited poor precision between the MS and MSD in sample MW-912-SP15. 2-Butanone is a poor performer and the individual recoveries were acceptable; therefore, no qualification of the data was made.
LCS within QC criteria? See Table 453 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits LCS and LCSD's associated with batches 182464, 182486 and 182654. The sample results were non-detect, and qualified UJ due to CCV failures. Methyl acetate was recovered above the control limit in the LCS associated with batch 182464. Cyclohexane and methylcyclohexane were recovered above the control limits in the LCSD associated with batch 182654. The analytes a poor performers, and they were not detected in the samples. No qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. The following samples were diluted due to target analytes exceeding the calibration curve: MW-4-SP15, MW-9-SP15, W-12-120-SP15, W-27-285-SP15, PW-02-07-SP15, and W-32-110-SP15. Only the target analyte is reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11082
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Sample W-02-70-SP15 matrix was orange in color and caused interference during analysis. The sample was wet ashed, treated in a muffle furnace, diluted 10X, and treated with a post-spike due to matrix effects and quenching, resulting in an elevated detection limit; the result was qualified with a UJ as not detected above the MDC, which is considered estimated or uncertain. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0257), methyl acetate(0.0131), 2-butanone(0.0320), and 2-hexanone(0.0674), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.1689) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSZ. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSZ; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 59.5% in ICV 160-182107/14. The sample results were qualified UJ due to CCV failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11082
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 87.6% in CCV 160-182486/6. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect. 1,1,2,2-tetrachloroethane exhibited a % D of 87.6% and methyl acetate exhibited a %D of 23.6 in CCV 160-182464/4. The analytes were not detected in any of the samples. Methyl acetate is a poor performer; therefore, the analyte is allowed a %D up to 40% per EPA SOP USEPA-540-R-08-01. Sample results for 1,1,2,2-tetrachloroethane were qualified UJ as estimated non-detect. 1,1,2,2-tetrachloroethane exhibited a % D of 66.4% in CCV 160-182654/4. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0249), methyl acetate(0.0135), 2-butanone(0.0298), and 2-hexanone(0.0724) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182486/6. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. Acetone(0.0260), methyl acetate(0.0162), 2-butanone(0.0389), and 2-hexanone(0.0750) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182464/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. Acetone(0.0225), methyl acetate(0.0145), 2-butanone(0.0327), and 2-hexanone(0.0694) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182464/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.

GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability

Major Concerns

None.

Minor Concerns

D5174

- Sample W-02-70-SP15 was wet ashed, treated in a muffle furnace, diluted 10X, and treated with a post-spike due to matrix effects and quenching, resulting in an elevated detection limit; the result was qualified with a UJ.

SW8260B

- Sample results for 1,1,2,2-tetrachloroethane were UJ qualified due to CCV failures.
- Sample results for acetone were U qualified as non-detect in sample PW-02-06-SP15 due to trip blank detections..
- Sample results for TCE and PCE were J qualified as estimated in sample MW-3-SP15 due to surrogate failures.

Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11098
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. Samples MW-206-320-SP15 and MW-206-470-SP15 were recorded on the COC, but not collected. The samples were not crossed off the COC prior to being sent to the laboratory. The MW's were sampled at a later date, and not received by the laboratory. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369739.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was collected for sample W-10-120-SP15. A field duplicate was collected for sample W-36-448-SP15 (MW-914-SP15). A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11098
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone was detected in Trip Blank 11.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Sample results for acetone were U qualified as non-detect in sample MW-209-380-SP15. The sample result was less than the PQL; therefore, the MDL was elevated to the sample result.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	Yes.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSD of W-10-120-SP15. The LCS/LCSD for the analyte was also non-compliant. The sample results for the analyte were UJ qualified for CCV failures. Cyclohexane was recovered high in the MS/MSD of W-10-120-SP15. The LCS/LCSD for the analyte was also non-compliant. The analyte is a poor performer and was not detected in the parent sample. No qualification of the data was made Styrene was recovered low in the MS/MSD of W-10-120-SP15. The analyte was not detected in the samples, and the parent sample results was qualified UJ as estimated non-detect.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11098
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits LCS and LCSD's associated with batch 182654. The sample results were non-detect, and qualified UJ due to CCV failures. Cyclohexane and methlycyclohexane were recovered above the control limit in the LCSD associated with batch 182654. The analytes are poor performing compounds. The sample results were non-detect; therefore, no qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples W-10-120-SP15, W-36-390-SP15, W-36-448-SP15, MW-209-380-SP15, and MW-914-SP15 were initially analyzed at a dilution. Elevated reporting limits are provided. The samples underwent a further diluted for analytes that exceeded the calibration curve. Only one result was reported.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11098
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	N/A The field duplicate sample pair were not analyzed for total uranium for this SDG.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11098
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 66.4% in CCV 160-182654/4. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0225), methyl acetate(0.0145), 2-butanone(0.0327), and 2-hexanone(0.0694) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 in CCV 160-182654/4. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
• Sample results for 1,1,2,2-tetrachloroethane were UJ qualified due to CCV failures. • Elevated reporting limits provided for samples W-10-120-SP15, W-36-390-SP15, W-36-448-SP15, MW-209-380-SP15, and MW-914-SP15 due to initial analysis completed at a dilution. • Sample results for acetone were U qualified as non-detect in sample MW-209-380-SP15.

Sample ID	Lab ID	Method	Sample Type	Action
W-10-120-SP15	160-11098-1	SW8260B	WG	Sample was initially analyzed at 2.5X dilution. Elevated reporting limits provided. The sample was diluted by 25X to bring Tetrachloroethylene (PCE) within the calibration curve. Only PCE is reported from the dilution.
W-36-390-SP15	160-11098-3	SW8260B	WG	Sample was initially analyzed at 5X dilution. Elevated reporting limits provided. The sample was diluted by 50X to bring Trichloroethylene (TCE) within the calibration curve. Only TCE is reported from the dilution.
W-36-448-SP15	160-11098-4	SW8260B	WG	Sample was initially analyzed at 2.5X dilution. Elevated reporting limits provided. The sample was diluted by 25X to bring Trichloroethylene (TCE) within the calibration curve. Only TCE is reported from the dilution.
MW-209-380-SP15	160-11098-8	SW8260B	WG	Sample was initially analyzed at 2.5X dilution. Elevated reporting limits provided. The sample was diluted by 25X to bring Trichloroethylene (TCE) and Tetrachloroethylene (PCE) within the calibration curve. Only TCE and PCE are reported from the dilution.
MW-914-SP15	160-11098-10	SW8260B	WG	Sample was initially analyzed at 2.5X dilution. Elevated reporting limits provided. The sample was diluted by 25X to bring Trichloroethylene (TCE) within the calibration curve. Only TCE is reported from the dilution.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan

QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11116
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 370339.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was collected for sample PW-07-06-SP15. The laboratory used MW-205-285-SP15 and MW-212-580-SP15 for laboratory QC of Method SW8260B. A field duplicate was collected for sample MW-210-380-SP15 (MW-915-SP15). A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11116
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. 2-Butanone, 2-hexanone, acetone, and toluene were detected in Trip Bank 12.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Sample results for acetone were U qualified as non-detect in samples MW-205-285-SP15, MW-210-380-SP15, MW-915-SP15, and PW-06-06-SP15. Sample results for 2-butanone and 2-hexanone were U qualified as non-detect in sample MW-205-285-SP15. If the sample result was less than the PQL, the MDL was elevated to the sample result; however, if the sample result was greater than the PQL, then the PQL was elevated to the sample result.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods.*	No. Dibromofluoromethane was recovered high in sample MW-205-470-SP15. The only detected result was tetrachloroethylene (PCE), which was already qualified J due to the sample result being between the MDL and PQL. No further action was taken. The sample was not re-analyzed and there were no indications of matrix effects from the chromatogram.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were <u>≤</u>30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSD of MW-205-285-SP15, MW-212-580-SP15, and PW-07-06-SP15. The LCS/LCSD for the analyte was also non-compliant. The sample results for the analyte were UJ qualified for CCV failures. Cyclohexane, methylcyclohexane, and acetone were recovered high in the MS/MSD of MW-205-285-SP15. The analytes are poor performers and were not detected in the parent sample. No qualification of the data was made.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11116
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits LCS and LCSD's associated with batches 184199, 183122, and 182682. The sample results were non-detect, and qualified UJ due to CCV failures. Cyclohexane was recovered above the control limit in the LCS associated with batch 184199. The sample results were non-detect; therefore, no qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Sample MW-10-SP15 was initially analyzed at a 2.5 dilution. Elevated reporting limits are provided. The following samples were diluted due to target analytes exceeding the calibration curve: MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-205-285-SP15, MW-210-280-SP15, MW-915-SP15, and MW-210-380-SP15. Only the target analyte is reported from the dilution.
Do field duplicate results show good precision for all compounds? See Table 7	Yes.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	N/A The field duplicate sample pair were not analyzed for total uranium for this SDG.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No. 1,4-Dichlorobenzene-d4 was recovered low in batch 182682 and the following samples were impacted: MW-206-470-SP15, MW-210-280-SP15, MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-210-280-SP15, and MW-210-380-SP15. Sample results for 1,4-dichlorobenzene in samples MW-210-280-SP15 and MW-210-380-SP15 were qualified J as estimated. The remaining results for bromoform, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene were non-detect and qualified UR for rejected non-detect. The samples were not re-analyzed and there were no indications of matrix effects from the chromatograms.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0257), methyl acetate(0.0131), 2-butanone(0.0320), and 2-hexanone(0.0674), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSM. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.1689) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSZ. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSZ; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 59.5% in ICV 160-182107/14. The sample results were qualified UJ due to CCV failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. 1,1,2,2-tetrachloroethane exhibited a % D of 62.9% in CCV 160-182682/2 and a % D of 72.3 in CCV 160-183122/4. The analyte was not detected in any of the samples; therefore, they were qualified UJ as estimated non-detect. Dichlorodifluoromethane(26.8), trichlorofluoromethane(26.8), carbon tetrachloride(23.4), 1,1,1-trichloroethane(23.1), and 1,1,2,2-tetrachloroethane(55.7) each exhibited a % D greater than the laboratory criteria of 20% in CCV 160-184199/4. Dichlorodifluoromethane, and trichlorofluoromethane are poor performers; however, per EPA SOP USEPA-540-R-08-01, a %D <40% is acceptable for poor performers and a %D <25% is acceptable for normal analytes. No qualification of the data was made. Results for ,1,2,2-tetrachloroethane were UJ qualified due to %D failures.

Summary of Potential Impacts on Data Usability

Major Concerns

- Sample results for bromoform, 1,3-dichlorobenzene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene were UR qualified as rejected non-detect due to internal standard failures in samples MW-206-470-SP15, MW-210-280-SP15, MW-10-SP15, MW-11-SP15, PW-06-07-SP15, MW-210-280-SP15, and MW-210-380-SP15.

Minor Concerns

- Sample results for 1,1,2,2-tetrachloroethane were UJ qualified due to CCV failures.
- Elevated reporting limits provided for sample MW-10-SP15 due to a 2.5X dilution.
- Sample results for acetone were U qualified as non-detect in samples MW-205-285-SP15, MW-210-380-SP15, MW-915-SP15, and PW-06-06-SP15.
- Sample results for 2-butanone and 2-hexanone were U qualified as non-detect in sample MW-205-285-SP15.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11161-1
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. The cooler temperature was 1.9°C at receipt. The samples were noted to be received in good condition.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was not collected for the sample delivery group; however, the laboratory used MW-15D-SP15 for laboratory QC of Method SW8260B, and MW-206-320-SP15 for laboratory QC of Method SW6010B.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11161-1
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. 2-Butanone, 2-hexanone, acetone, and toluene were detected in Trip Blank 13. 2-Butanone, 2-hexanone, and acetone were detected in RB03-SP15.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Results for 2-butanone, 2-hexanone, and acetone were U qualified as non-detect in the RB03-SP15 due to positive detections in Trip Blank 13. The result for acetone in sample MW-204-470-SP15 was U qualified as non-detect due to a positive detection in Trip Blank 13. If the sample result was less than the PQL, the MDL was elevated to the sample result; however, if the sample result was greater than the PQL, then the PQL was elevated to the sample result.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. 4-Bromofluorobenzene was recovered high in sample MW-15D-SP15. The sample did not have any reportable results; therefore, no qualification of the data was made. The sample was not reanalyzed and there were no indications of matrix effects from the chromatogram.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the MS/MSD of MW-15D-SP15. The LCS/LCSD for the analyte was also non-compliant. The sample results for the analyte were UJ qualified for CCV failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11161-1
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	No. 1,1,2,2-tetrachloroethane was recovered above the control limits in the LCS/LCSD 160-183712/5. The sample results were non-detect, and previously qualified UJ due to CCV failures. Cyclohexane was recovered above the control limits in the LCS 160-183712/5. The sample results were non-detect; therefore, no qualification of the data was made.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Sample MW-204-320-SP15 was initially analyzed at a 2.5 dilution. Elevated reporting limits are provided. The sample was further dilute by 25X due to high concentrations of tetrachloroethylene. Only one result is reported.
Do field duplicate results show good precision for all compounds? See Table 7	N/A No field duplicate sample pair was included in this SDG.

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2.	No.
Were all samples run under acceptable calibration?	Yes.
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank then "U" flag data.*	No.
LCS within QC criteria (75-125% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11161-1
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Total U Analysis - Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7.	N/A No field duplicate sample pair was included in this SDG.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to check for quenching; only one result is reported per sample. No qualifiers were required.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0224), methyl acetate(0.0131), 2-butanone(0.0354), and 2-hexanone(0.0654), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2040) was less than the laboratory minimum of 0.300; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11161-1
Date Completed: 03 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	No. Dichlorodifluoromethane(28.6) and 1,1,2,2-tetrachloroethane(70.7) exceeded the % D in CCV 160-183712/4. Dichlorodifluoromethane is a poor performer; therefore, per EPA SOP USEPA-540-R-08-01, a % D <40% is acceptable. No qualification of the data was made. 1,1,2,2-tetrachloroethane was not detected in any of the samples. The sample results were qualified UJ as estimated non-detect.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0284), methyl acetate(0.0154), 2-butanone(0.0371), and 2-hexanone(0.0760), exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	Yes.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.

Summary of Potential Impacts on Data Usability
Major Concerns
• None.
Minor Concerns
• Sample results for 1,1,2,2-tetrachloroethane were UJ qualified due to CCV failures.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct?	The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event. A MS/MSD was not collected for the sample delivery group. MW-211-190-SP15, MW-211-455-SP15, and S-1-450-SP15 were used as laboratory QC. A field duplicate was not collected for the sample delivery group. A trip blank was provided in each cooler with samples for VOC analysis.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes. Insufficient sample volume was available to perform a MS/MSD/DUP associated with batch 190437. The associated samples dilutions for target analytes. A LCS/LCSD was analyzed which is acceptable.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11682
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2	Yes. Acetone was detected in Trip Blank 14.
Were any analytes flagged for blank contamination? See Tables 2A and 2B *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	Yes. Sample results for acetone were U qualified as non-detect in samples MW-211-455-SP15, MW-213-570-SP15, and MW-211-190-SP15.
Surrogate for method blanks and LCS within limits? See Table 3 *Organic Methods Only*	Yes.
Surrogate for samples and MS/MSD within limits? *Organic Methods Only*. See Table 3 Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. p-Bromofluorobenzene was recovered high in MW-P114-290-SP15. The positive results in the sample were qualified J as estimated.
MS/MSD within QC criteria? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	No. Iron, lead, manganese, nickel, sodium, thallium were recovered high in the MS/MSD of MW-211-455-SP15 by Method 6010B. The analytes were J qualified for positive detections. No qualification was made for analytes that were non-detect.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11682
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
LCS within QC criteria? See Table 5 *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.
Were any samples re-analyzed or diluted? See Table 6 *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Samples MW-P110-355-SP15 and MW-P110-440-SP15 were initially analyzed at 2.5X by Method 8260. Elevated reporting limits are provided. The samples were further diluted due to target analytes exceeding the calibration curve. Only one result was reported. Samples MW-211-455-SP15 and MW-211-455-SP15-F were diluted for analysis by Method 6010 due to the nature of the matrix. Elevated reporting limits are provided.
Do field duplicate results show good precision for all compounds? See Table 7	N/A A field duplicate was not collected with the SDG.

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	Yes.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11682
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0299), methyl acetate(0.0115), 2-butanone(0.0382), 2-hexanone(0.0683) and 1,2-dibromo-3-chloropropane(0.0483) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for the initial calibration on instrument VMSL. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2893) was less than the laboratory minimum of 0.300 for the initial calibration on instrument VMSM; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes.

Method	**Description**	**Notes and Qualifiers**
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. Acetone(0.0332), methyl acetate(0.0100), 2-butanone(0.0342), 2-hexanone(0.0715) and 1,2-dibromo-3-chloropropane(0.0485) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for CCV 160-190287/3. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2695) was less than the laboratory minimum of 0.300 for CCV 160-190287/3; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made. Acetone(0.0374), methyl acetate(0.0106), 2-butanone(0.0356), 2-hexanone(0.0687) and 1,2-dibromo-3-chloropropane(0.0499) exhibited minimum relative response factors (RRF) less than the laboratory minimum of 0.100 for CCV 160-190287/3. These analytes are poor performers; therefore, per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made. The RRF for 1,1,2,2-tetrachloroethane(0.2838) was less than the laboratory minimum of 0.300 for CCV 160-190287/3; however, per EPA SOP USEPA-540-R-08-01, a RRF >0.050 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.
ICP	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	No. Arsenic(123%), cadmium(150%), lead(144%), nickel(121%, and zinc(125%) were all recovered greater than 20% of the expected value in CRI 160-192334/7. Zinc and lead were the only analytes detected, and the results were already qualified J as estimated for result value between the MDL and RL.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-11682
Date Completed: 04 June 2015	Data Validation Chemist: J. Z. Christopher, Lynne Kalmbach
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
ICP	ICB/CCB detections <2X MDL?	No. Beryllium was detected in the CCB 160-192334/64 at 1.8ug/L, which is greater than 2X the MDL. Beryllium was not detected in the samples; therefore, no qualification was required.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	No. Calcium was recovered at 13% in sample MW-211-455-SP15. The calcium results were qualified J as estimated in MW-211-455-SP15 and MW-211-455-SP15-F.

Summary of Potential Impacts on Data Usability
Major Concerns
None.
Minor Concerns
• Elevated reporting limits are provided for samples MW-P110-355-SP15 and MW-P110-440-SP15 due to an initial analysis dilution of 2.5X by Method 8260. • Elevated reporting limits are provided for samples MW-211-455-SP15 and MW-211-455-SP15-F due to the nature of the matrix by Method 6010. Elevated reporting limits are provided. • Calcium results in samples MW-211-455-SP15 and MW-211-455-SP15-F were J qualified as estimated due to the serial dilution recovery exceeding 10%.

Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. The cooler temperature was 1.8°C at receipt. The samples were noted to be received in good condition.
Frequency of Field QC Samples Correct?	N/A The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	Yes.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Key:

AP = Acid Phenol
BN = Base Neutral
CCV = Continuing calibration verification
COC = Chain-of-custody
CVAA = Cold Vapor Automatic Absorption
GC = Gas Chromatography
GC/MS = Gas Chromatography/Mass Spectrometry
ICP = Inductively Coupled Plasma Argon Spectrometry
ICS = Interference check standard
ICV = Initial calibration verification
NA = Not Applicable
LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/Matrix Spike Duplicate
QAPP = Quality Assurance Project Plan
QC = Quality Control
SD = Serial Dilution
SVOCs = Semivolatile Organic Compounds
TIC = Tentatively Identified Compound
VOCs = Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-12232-1, 160-12232-2
Date Completed: 5 August 2015	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

The samples and analytical methods included in this sample delivery group (SDG) are documented in Table 1 Sample Summary and Table 2 Method Summary. All data qualification was reviewed and approved by the qualified Data Validation Chemist listed in the heading of this DUSR.

Specific criteria for reporting and QC limits were obtained from the project Quality Assurance Project Plan (QAPP). Compliance with the project QC criteria is documented in this DUSR. The checklist and tables summarize the data review process and summarize the data that is qualified due to non-conformance with the QAPP. Any major or minor concerns affecting data usability are summarized below. The representativeness and comparability of the data are evaluated to determine how data usability may be impacted.

Completeness Review - General Sample and Batch Information - See Attachment	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes. The laboratory re-issued the data package and EDD because they had inadvertently switched sample IDs for metals and VOC results in the original versions. The case narrative was not updated for the discussion of internal standard failure and referenced sample DRY-J-B1-19-Z3 instead of DRY-H-J-SG3 in the VOC discussion section.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. The samples were received in good condition at a temperature of 12.3 °C. The client was notified and instructed the lab to proceed with analyses. VOC results were qualified with a J for detected compounds and a UJ for nondetects because the temperature upon receipt was above criteria.
Frequency of Field QC Samples Correct?	Yes.
Laboratory QC frequency correct? *Method blank and LCS with each batch and one set of MS/MSD per 20 samples?*	One MS/MSD was collected but there was sufficient sample to perform MS/MSD analyses for metals only. For VOCs, LCS/LCSD analyses were performed instead. An MS/MSD is not required for alpha or gamma spectroscopy. No field duplicates were collected this round. One trip blank was included.
All forms and raw data complete?	Yes.
Case narrative present and complete?	Yes.
Target analyte list and reporting limits match QAPP?	Yes.

Date Performed:	Data Validation Review:

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method, trip and field blanks? See Table 2.	Yes. SW8260: 2-Butanone (MEK) and Acetone were detected in the trip blank (TRIP BLANK 060215). SW6010: Lead was detected in method blank MB 160-194547/1-A. Lead and cadmium were detected in continuing calibration blanks (CCB).
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank or <10 times blank for common laboratory contaminants then "U" flag data. Qualification also applies to TICs reported with GC/MS.*	SW8260: Acetone results were U qualified in several samples due to positive detection in the trip blank (TRIP BLANK 060215). SW6010: Lead results were U qualified in samples DRYH-J-SG2 and DRY-J-B1-19-Z3 due to detection in the associated CCBs.
Surrogate for method blanks and LCS within limits? See Table 3. -- *Organic Methods Only*	No. SW8260: The surrogate recovery for 4-bromofluorobenzene was high in MB 160-195480/9. No qualification of the data was made.
Surrogate for samples and MS/MSD within limits? See Table 3. -- *Organic Methods Only* Were appropriate samples re-analyzed? *All samples should be re-analyzed for VOCs. Matrix effects should be established for all other methods. Only samples exceeding these criteria are listed on the Surrogate Outlier Report.*	No. SW8260: Toluene-d8 and 4-bromofluorobenzene were recovered high in TRIP BLANK 060215. 4-bromofluorobenzene was recovered high in DRYH-J-SG1, DRYH-J-SG, and DRYH-J-SG3. The results for detected compounds in the samples were qualified J as estimated. No qualification was made on non-detect results.

Compliance Review Chemical Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
MS/MSD within QC criteria? See Table 4. *If out and LCS is compliant, then J flag positive data in original sample due to matrix.* *If metal recoveries were ≤30%, then "R" flag associated non-detect values.*	SW8260B: Insufficient sample volume was available to perform a MS/MSD; however, an LCS/LCSD was analyzed, which is acceptable, with acceptable recoveries. SW6010: The MS/MSD recoveries for sample DRYH-J-SG1 for aluminum, copper, iron, and zinc were outside criteria. The parent sample results for aluminum, copper, and zinc were qualified with a J as estimated. For the parent sample result for iron; no qualifier was required because the sample concentration exceeded the spike concentration more than four times. The MS recovery for potassium was outside criteria; however, the MSD and RPD as well as the LCS were acceptable; therefore, no qualifiers were added. The PDS recovered high for chromium and lead; the parent sample results were qualified with a J as estimated. SW6020: The MS/MSD recoveries for sample DRYH-J-SG1 for uranium-234, uranium-235, and uranium-238 were outside criteria. No qualifiers were required because the sample concentration exceeded the spike concentration more than four times. SW7471: The MS recovery for mercury was outside criteria; however, the MSD and RPD as well as the LCS were acceptable; therefore, no qualifiers were added.
LCS within QC criteria? See Table 5. *If out, and the recovery high with no positive values, then no data qualification is required. Positive results are "J" flagged and non-detects are "J" flagged if low. Reject data with recovery <10%.*	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. SW6010: The samples were diluted due to the sample matrix. SW6020: The samples were diluted due to high target analyte concentrations.
Do field duplicate results show good precision for all compounds? See Table 7.	No field duplicate samples were included with this SDG.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-12232-1, 160-12232-2
Date Completed: 5 August 2015	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
GC/MS	Do internal standards areas and retention time meet criteria? *Samples should be re-analyzed to establish matrix effects or chromatograms documenting matrix effects provided.*	No. The internal standard 1,4-dichlorobenzene-d4 exhibited area counts less than the lower limit in sample DRY-H-J-SG3. The detected sample results were qualified J as estimated and the non-detect results were qualified UR as rejected.
GC/MS	Does initial calibration meet criteria for all positive target compounds? (<30% RSD for CCCs and <15% for each analyte or curve fit)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	No. SW8260 ICV: Acetone (0.0702), and methyl acetate (0.0229) exhibited relative response factors (RRF) less than the laboratory minimum in batch 194991. Acetone (0.0299), methyl acetate (0.0115), 2-butanone (0.0382), 1,1,2,2,-tetrachloroethane (0.2893), 2-hexanone (0.0683), and 1,2-dibromo-3-chloroproane (0.0483) exhibited relative response factors (RRF) less than the laboratory minimum in batch 190178. In cases, the analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	Does second source calibration verification meet criteria? (25% of expected value for each analyte)	Yes.
GC/MS	Does continuing calibration meet criteria for all positive target compounds? (<20% D for each analyte)	Yes.
	Is the minimum response factor met for all compounds? (≥0.30 for chlorobenzene and 1,1,2,2,-PCA, ≥0.10 for chloromethane, bromoform, 1,1-DCA)	SW8260 CCV: 2-butanone (0.0352), 2-hexanone (0.0623), 1,1,2,2,-tetrachloroethane (0.2971), 4-methyl-2-pentanone (MIBK – 0.0940), acetone (0.0335), and methyl acetate (0.0112) exhibited relative response factors (RRF) less than the laboratory minimum in batch 195480. Acetone (0.0860), and methyl acetate (0.0222) exhibited relative response factors (RRF) less than the laboratory minimum in batch 194991. In cases, the analytes are poor performers and per EPA SOP USEPA-540-R-08-01, a RRF >0.010 is acceptable. No qualification of the data was made.
GC/MS	For TICs are there any system related compounds that should not be reported?	N/A
ICP	ICS recoveries within 80-120%?	Yes.
ICP	ICV recoveries within 90-110%?	Yes.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-12232-1, 160-12232-2

Date Performed:	Data Validation Review:

Compliance Review Organic Analyses by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
CVAA	CCV recoveries within 90-110% or 80-120% for mercury?	Yes.
ICP	CRI recoveries within 20% of expected value?	No. Chromium,and lead were recovered high in CRI 160-196420/7. The associated sample results were bracketed by CCVL at the same concentration and the same source as the CRI, which were within acceptance criteria; therefore, no qualification of the data was made.
ICP	ICB/CCB detections <2X MDL?	Yes.
ICP	Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	Yes.
ICP/MS	Is there one serial dilution per 20 samples? Serial dilution recoveries within 90-110% for concentrations greater than 50 times reporting limit?	The serial dilution results were acceptable.
ICP/MS	ICV recoveries within 95-105%?	Yes.
ICP/MS	ICS recoveries within 80-120%?	Yes.

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	No
Were any analytes flagged for blank contamination? See Tables 2A and 2B. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No
LCS within QC criteria (70-130% recovery)? See Table 5. *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.

Date Completed: 5 August 2015	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.
Do field duplicate results show good precision for all isotopes? See Table 7. *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	N/A. No field duplicate was included with this SDG.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were background and continuing calibration checks performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check spectra and calculations; qualify per USACE guidance.*	No.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Compliance Review Radiochemical Analyses Approval by Data Validation Chemist		
Method	**Description**	**Notes and Qualifiers**
Gamma Spec	Was the soil matrix density comparable to the calibration standard density? (70-130%) *If not comparable, qualify results with J.*	Yes.
Gamma Spec	Were the samples prepared in sealed containers and subjected to a 21-day ingrowth period prior to analysis? *If not, qualify results with J.*	Yes.
Alpha Spec	Were background and continuing calibration checks (pulsers) performed daily?	Yes.
Alpha Spec	Were tracer yields within limits (QAPP: 50-100%, lab 30-110%)? *If recoveries were outside laboratory derived limits, but within default limits of 20-150%, flag associated results as estimated (J) after corrective actions; otherwise R. If recoveries are <20%: flag as rejected (R) and >150% rejected (R).*	Yes.
Alpha Spec	If recoveries were outside control limits, were adequate quantities of tracers used and were calculations correct? *Evaluate entire SDG for systematic errors and qualify if needed*	Yes. All tracer recoveries were within limits.
Alpha Spec	MS/MSD within QC criteria for Alpha Spectroscopy (70-130% recovery, RPD ± 35)? *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	N/A. MS/MSD are optional for alpha spec and were not performed for this SDG.

Summary of Potential Impacts on Data Usability

A-01-R

- There is no valid value for EPAR2 for the analytical method A-01-R; therefore the EDD does not pass the EDP check for this method.

GA-01-R

- The valid value for EPAR2 for the analytical method is EML GA-01-R; therefore the EDD references EML GA-01-R instead of GA-01-R for these analyses.

SW8260

- The case narrative referenced sample DRY-J-B1-19-Z3 instead of DRY-H-J-SG3 in the VOC discussion section about internal standard failure in the revised report. The report was revised because the initial report had switched the two sample IDs listed above for VOC and metals analyses.
- The samples were received at 12.3 degrees C; therefore VOC results were qualified with a J for detected compounds and a UJ for nondetects.
- There was insufficient sample to perform MS/MSD for VOCs; therefore an LCS/LCSD was performed instead.
- Acetone results were qualified with a U due to acetone detected in the trip blank.
- Surrogate recoveries were above criteria for three samples, causing detected results to be qualified with a J as estimated.
- Internal standard area counts were below criteria for sample DRY-H-J-SG3; therefore detected sample results were qualified with a J as estimated and nondetects were qualified with a UR as nondetected-rejected.
- ICVs and CCVs for poor performing compounds exhibited RRF below criteria; no qualification was required.

SW6010

- Lead and cadmium were detected in CCBs; some lead results were qualified with a U as nondetect.
- Lead was detected in the method blank; no sample results were qualified on this basis because they were already qualified with a U due to the CCB.
- MS/MSD recoveries for aluminum, copper, and zinc were outside criteria; therefore, the parent sample results were qualified with a J as estimated.
- The post digestion spike recoveries for chromium and lead were outside criteria; therefore, the parent sample results were qualified with a J as estimated.

DRYH-J-SG2	160-12232-2	SW6010A	SO	Initial analysis run at a 10X dilution due to the nature of the matrix. Elevated reporting limits provided.
DRYH-J-SG3	160-12232-3	SW6010A	SO	Initial analysis run at a 10X dilution due to the nature of the matrix. Elevated reporting limits provided.
DRY-J-B1-19-Z3	160-12232-4	SW6010A	SO	Initial analysis run at a 10X dilution due to the nature of the matrix. Elevated reporting limits provided.
DRYH-J-SG1	160-12232-1	SW6020A	SO	Initial analysis run at a 5X dilution due to the high concentration of target analytes. Elevated reporting limits provided.
DRYH-J-SG2	160-12232-2	SW6020A	SO	Initial analysis run at a 5X dilution due to the high concentration of target analytes. Elevated reporting limits provided.
DRYH-J-SG3	160-12232-3	SW6020A	SO	Initial analysis run at a 5X dilution due to the high concentration of target analytes. Elevated reporting limits provided.
DRY-J-B1-19-Z3	160-12232-4	SW6020A	SO	Initial analysis run at a 5X dilution due to the high concentration of target analytes. Elevated reporting limits provided.
DRYH-J-SG1	160-12232-1	SW6020A	SO	Initial analysis run at a 500X dilution due to the high concentration of U-238. Elevated reporting limits provided.
DRYH-J-SG3	160-12232-3	SW6020A	SO	Initial analysis run at a 500X dilution due to the high concentration of U-238. Elevated reporting limits provided.

Table 7 – Summary of Field Duplicate Results

None.

Data Usability Summary Report	Project: Sylvania Off Site Groundwater
Laboratory: TestAmerica, St Louis	LAB SDG ID: 160-12232-1, 160-12232-2
Date Completed: 5 August 2015	Data Validation Chemist: J. Z. Christopher
Date Performed:	Data Validation Review:

Key:

AP	=	Acid Phenol
BN	=	Base Neutral
CCV	=	Continuing calibration verification
COC	=	Chain-of-custody
CVAA	=	Cold Vapor Automatic Absorption
GC	=	Gas Chromatography
GC/MS	=	Gas Chromatography/Mass Spectrometry
ICP	=	Inductively Coupled Plasma Argon Spectrometry
ICS	=	Interference check standard
ICV	=	Initial calibration verification
NA	=	Not Applicable
LCS	=	Laboratory Control Sample
MS/MSD	=	Matrix Spike/Matrix Spike Duplicate
QAPP	=	Quality Assurance Project Plan
QC	=	Quality Control
SD	=	Serial Dilution
SVOCs	=	Semivolatile Organic Compounds
TIC	=	Tentatively Identified Compound
VOCs	=	Volatile Organic Compounds

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

The analytical data provided by the laboratory were reviewed for precision, accuracy, and completeness based on applicable sections of the following guidelines.

- NYSDEC Division of Environmental Remediation Guidance for Data Deliverables and the Development of Data Usability Summary Reports (in DER-10, May 2010)
- EPA Region 2 Data Validation SOPs
- Department of Defense (DoD) Quality Systems Manual for Environmental Laboratories Version 5.0
- USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy, Revision 01

Specific criteria for QC limits were obtained from the project specific QAPP. Compliance with the project QA program is indicated in the checklist and tables below. Any major or minor concerns affecting data usability are listed below. The checklist and tables also indicate whether data qualification is required and/or the type of qualifier assigned.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

General Sample Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. Nitric preserved bottles were sent to the laboratory, but nickel analysis was not indicated on the COC. Per the client, the following samples were logged in for nickel analysis: MW-58-75-WI15, MW-59-75-WI15, and MW-607-WI15. The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 365777.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct? Field Duplicate - 1/10 samples MS/MSD – 1/20 samples up to one week or 5% Trip Blank - Every cooler with VOCs waters only Equipment Blank - 1/ set of samples per day?	No. 1 field duplicate per 8 samples Trip blank was not included MS/MSD was not collected Equipment blank was not collected Note: The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event.
Case narrative present and complete?	Yes.
Any holding time violations?	No.

The following tables are presented at the end of this DUSR and provide summaries of results outside QC criteria:

- Method Blanks Results (Table 2)
- Surrogates Outside Limits (Table 3)
- MS/MSD Outside Limits (Table 4)
- LCS Outside Limits (Table 5)
- Reanalysis Results (Table 6)
- Field Duplicate Results (Table 7)

Go to Tables List

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	No.
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	No qualifications required.
Are surrogates for method blanks and LCS within limits?	Yes.
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	Yes.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then "J" flag positive data in original sample due to matrix.	A MS/MSD was not indicated on the COC; however, the laboratory used sample MW-59-75-WI15 as laboratory QC. The results were acceptable.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	No. Cyclohexane and methylcyclohexane were recovered high in LCS and/or LCSD 160-170969/5. The associated samples were non-detect for the analytes; therefore, no qualification of the data was made.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix?	No. 8260B-SIM: 1,4-Dioxane-d8 was recovered low in sample MW-216-510-WI15. The laboratory reanalyzed the sample and the failure was reproduced, which indicates matrix effects. The result was qualified J as estimated.
Is initial calibration for target compounds <15% RSD or curve fit?	Yes. The following poor performing analytes exhibited an RRF value less than the laboratory minimum criterion of 0.1000: acetone, methyl acetate, 2-butanone, and 2-hexanone. The RRF values were ≥0.0100; the allowance for poor performing analytes per EPA Region 2 SOP HW-33, Rev 3. The %RSD was acceptable and the associated results were non-detect for the analytes. No qualification of the data was made.
Is continuing calibration for target compounds < 20.5% D.	For CCV 160-170969/4, the following analytes exceeded 20% D: Dichlorodifluoromethane(24.1), trichlorofluoromethane (21.2), carbon tetrachloride(21.2), and styrene(20.7). The following analytes exceeded the minimum relative response factor(RRF): acetone(0.0315), methyl acetate(0.0175), 2-butanone(0.0373), and 2-hexanone(0.0885).

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
	Acetone, 2-butanone, dichlorodifluoromethane, 2-hexanone, dichlorodifluoromethane, trichlorofluoromethane, and methyl acetate are all poor performing compounds. %D ≤ 40% and min RRF ≥0.010 is acceptable per EPA Region 2 SOP HW-33, Rev 3. For all other volatile compounds, the SOP allows up the 25% D. All analytes except for carbon tetrachloride were not detected in the samples. No qualification of the data was made for the non-detect results. Carbon tetrachloride was detected in sample MW-219-560-WI15, which was reanalyzed under an acceptable CCV 160-171425/4. Only the target analyte was reported form the re-analysis.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. MW-219-560-WI15, MW-220-325-WI15, MW-58-75-WI15, and MW-607-WI15 were dilute due to elevated levels of tetrachloroethene and/or trichloroethene. Only the target analytes were reported from the dilution. MW-219-560-WI15 and MW-220-325-WI15 were initially analyzed at dilutions prior to being further diluted due to target analytes exceeding the calibration curve. Elevated reporting limits are provided for non-detect analytes.
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Total Metals by ICP	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	Yes. Nickel was detected in the continuing calibration blank (CCB) 160-170576/12; however, the CCB did not bracket the samples.
For samples, if results are < 5 times the blank then "U" flag data.	No qualification required.
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	Yes. The laboratory performed a MS/MSD analysis on sample MW-58-75-WI15. The recoveries were acceptable.
Were elements recovered ≤30%? If so, “R” flag associated NDs on Form 1's.	No.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP	
Description	**Notes and Qualifiers**
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	Yes.
Is there one serial dilution per 20 samples? Flag all data reported with an "E" as "J".	Yes.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	ICV recoveries were acceptable.
Spot check CCV 90-110% or 80-120% for mercury. Contact lab if unacceptable.	CCV recoveries were acceptable.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	No.
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Total U Analysis by KPA	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2	No.
Were any analytes flagged for blank contamination? See Table 2A *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No.
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total U Analysis by KPA	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision? See Table 7	Yes.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Sample MW-58-75-WI15 was re-analyzed with a post-spike to test for quenching. No evidence of quenching was found, so the original result was reported and no qualifiers were required.
Were all samples run under acceptable calibration?	Yes.

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	Yes. U-238 was detected in the method blank above the uncertainty or MDC but below the PQL.
Were any analytes flagged for blank contamination? See Table 2A. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	Yes. The U-238 result for sample MW-218-95-WI15 was <5 times the blank concentration and did not pass the USACE NAD test; therefore, it was qualified with J as estimated.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Alpha Spectroscopy (70-130% recovery, RPD ± 35)? *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	N/A An MS/MSD was not required for alpha spectroscopy.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes. LCS/LCSD were analyzed instead of a matrix duplicate sample. Results were within criteria.
Do field duplicate results show good precision for all isotopes? *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	No. Sample MW-607-WI15 was the field duplicate for sample MW-58-75-WI15. Precision was outside acceptance criteria for the U-233/234 results; therefore the results were qualified with a UJ as estimated (both results were below the MDC and 2-sigma uncertainty).
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were background and continuing calibration checks (pulsers) performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check calculations, qualify per USACE guidance.*	No.
Were tracer yields within limits (QAPP: 50-100%, lab 30-110%)? *If recoveries were outside laboratory derived limits, but within default limits of 20-150%, flag associated results as estimated (J) after corrective actions; otherwise R. If recoveries are <20%: flag as rejected (R) and >150% rejected (R).*	Yes.
If recoveries were outside control limits, were adequate quantities of tracers used and were calculations correct? *Evaluate entire SDG for systematic errors and qualify if needed*	N/A: All recoveries were within limits.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Summary of Potential Impacts on Data Usability
8260B • A trip blank was not included with the sample shipment. • MW-219-560-WI15 and MW-220-325-WI15 were initially analyzed at dilutions. Elevated reporting limits are provided for non-detect analytes. This may impact data comparability. 8260B-SIM • Sample results for MW-216-510-WI15 were J qualified as estimated due to internal standard failure. A-01-R • There is no valid value for EPAR2 for the analytical method A-01-R; therefore the EDD does not pass the EDP check. • The field duplicate precision was outside acceptance criteria for U-233/234; therefore, the U-233/234 results for the field duplicate sample pair (MW-58-75-WI15 and MW-607-WI15) were qualified with UJ as estimated. • U-238 was detected in the method blank; therefore, the U-238 result for sample MW-218-95-WI15 was qualified with J as estimated.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	No
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	No qualifications required.
Are surrogates for method blanks and LCS within limits?	Yes.
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	Yes.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then "J" flag positive data in original sample due to matrix.	A MS/MSD was not provided in the sample delivery group.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	No. Cyclohexane and methylcyclohexane were recovered high in LCS and/or LCSD 160-170969/5. The associated samples were non-detect for the analytes; therefore, no qualification of the data was made.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix?	Yes.
Is initial calibration for target compounds <15% RSD or curve fit?	Yes. The following poor performing analytes exhibited an RRF value less than the laboratory minimum criterion of 0.1000: acetone, methyl acetate, 2-butanone, and 2-hexanone. The RRF values were ≥0.0100; the allowance for poor performing analytes per EPA Region 2 SOP HW-33, Rev 3. The %RSD was acceptable and the associated results were non-detect for the analytes. No qualification of the data was made.
Is continuing calibration for target compounds < 20.5% D.	For CCV 160-170969/4, the following analytes exceeded 20% D: Dichlorodifluoromethane(24.1), trichlorofluoromethane (21.2), carbon tetrachloride(21.2), and styrene(20.7). The following analytes exceeded the minimum relative response factor: acetone(0.0315), methyl acetate(0.0175), 2-butanone(0.0373), and 2-hexanone(0.0885). Acetone, 2-butanone, dichlorodifluoromethane, 2-hexanone, dichlorofluoromethane, trichlorofluoromethane, and methyl acetate are all poor performing compounds. %D ≤ 40% and min RRF ≥0.010 is acceptable per EPA Region 2 SOP HW-33, Rev 3. For all other volatile compounds, the SOP allows up the 25% D. The analytes were not detected in the samples. No qualification of the data was made.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: WI15
Date Completed: April 29, 2015	Completed by: Lynne Kalmbach

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	No.
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	N/A A field duplicate was not provided in the sample delivery group.

Summary of Potential Impacts on Data Usability
8260B • A trip blank was not included with the sample shipment.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

The analytical data provided by the laboratory were reviewed for precision, accuracy, and completeness based on applicable sections of the following guidelines.

- NYSDEC Division of Environmental Remediation Guidance for Data Deliverables and the Development of Data Usability Summary Reports (in DER-10, May 2010)
- EPA Region 2 Data Validation SOPs
- Department of Defense (DoD) Quality Systems Manual for Environmental Laboratories Version 5.0
- USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy, Revision 01

Specific criteria for QC limits were obtained from the project specific QAPP. Compliance with the project QA program is indicated in the checklist and tables below. Any major or minor concerns affecting data usability are listed below. The checklist and tables also indicate whether data qualification is required and/or the type of qualifier assigned.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

General Sample Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes The analyses for total uranium by kinetic phosphorescence were performed by GEL Laboratories under subcontract to TestAmerica St. Louis as GEL SDG 369354.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct? Field Duplicate - 1/10 samples MS/MSD – 1/20 samples up to one week or 5% Trip Blank - Every cooler with VOCs waters only Equipment Blank - 1/ set of samples per day?	No. 1 field duplicate per 8 samples 1 trip blank per VOC cooler MS/MSD was not collected Equipment blank was not collected Note: The SDG is part of a larger sampling event. Field QC will be assessed at the end of the sampling event.
Case narrative present and complete?	Yes. Note: The subcontracted data report for SDG 369354 referenced incorrect lab sample IDS (10969 instead of 10989); however, the IDs were correct in the remainder of the report and in the EDD; therefore, there is no impact on data usability.
Any holding time violations?	No.

The following tables are presented at the end of this DUSR and provide summaries of results outside QC criteria:

- Method Blanks Results (Table 2)
- Surrogates Outside Limits (Table 3)
- MS/MSD Outside Limits (Table 4)
- LCS Outside Limits (Table 5)
- Reanalysis Results (Table 6)
- Field Duplicate Results (Table 7)

Go to Tables List

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	Yes. Acetone and 2-butanone were detected in TRIP BLANK 06.
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	Acetone was detected in samples MW-215-395-SP15 AND MW-216-510-SP15 at levels below the trip blank detection, but above the PQL. The results were qualified U as non-detect. The PQL was elevated to the detected result.
Are surrogates for method blanks and LCS within limits?	No. 4-Bromofluorobenzene and toluene-d8 were recovered high in MB 160-180337/8 and MB 160-180642/8. No qualification of the data was made.
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	No. 4-Bromofluorobenzene was recovered high in samples MW-59S-SP15, MW-215-395-SP15, MW-58S-SP15, and MW-904-SP15. The positive detections in each sample were qualified J as estimated. 4-Bromofluorobenzene and toluene-d8 were recovered high in MW-217-490-SP15. The positive detections in each sample were qualified J as estimated.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then “J” flag positive data in original sample due to matrix.	A MS/MSD was not collected in this sample delivery group.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	No. Cyclohexane was recovered high in LCSD 160-180642/6. The associated samples were non-detect for the analytes; therefore, no qualification of the data was made.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix?	Yes.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Is initial calibration for target compounds <15% RSD or curve fit?	Yes. The following poor performing analytes exhibited an RRF value less than the laboratory minimum criterion of 0.1000/0.0500: acetone, methyl acetate, 2-butanone, 4-methyl-2-pentanone, 2-hexanone, and 1,2-dibromo-3-chloropropane. The RRF values were ≥0.0100; the allowance for poor performing analytes per EPA Region 2 SOP HW-33, Rev 3. The %RSD was acceptable and the associated results were non-detect for the analytes. No qualification of the data was made.
Is continuing calibration for target compounds < 20.5% D.	For CCV 160-180337/4, the following analytes exceeded 20% D: Bromomethane(-29.0), chloroethane(-20.3), 2-butanone(21.5), and styrene(25.5). The following analytes exceeded the minimum relative response factor: Acetone(0.0220), methyl acetate(0.0147), 2-butanone(0.0317), 4-methyl-2-pentanone(0.0907), and 2-hexanone(0.0575). For CCV 160-180642/4, the following analytes exceeded the minimum relative response factor: acetone(0.0246), methyl acetate(0.0160), 2-butanone(0.0324), 4-methyl-2-pentanone(0.0969), and 2-hexanone(0.0651). Acetone, 2-butanone, chloroethane, 2-hexanone, 4-methyl-4-pentanone, and methyl acetate are all poor performing compounds. %D ≤ 40% and min RRF ≥0.010 is acceptable per EPA Region 2 SOP HW-33, Rev 3. For all other volatile compounds, the SOP allows up the 25% D. No qualification of the data was made with the exception of styrene results associated with CCV 160-180337/4. The results were qualified UJ as estimated non-detect.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. MW-219-560-SP15, MW-220-325-SP15, MW-58S-SP15, and MW-904-SP15 were dilute due to elevated levels of tetrachloroethene and/or trichloroethene. Only the target analytes were reported from the dilution. MW-219-560-SP15, MW-220-325-SP15, and MW-904-SP15 were initially analyzed at dilutions prior to being further diluted for high concentrations. Elevated reporting limits are provided for non-detect analytes.
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	No.
For samples, if results are < 5 times the blank then "U" flag data.	Not required.
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	Yes. The laboratory performed a MS/MSD analysis on sample MW-58S-SP15. The recoveries were acceptable.
Were elements recovered ≤30%? If so, "R" flag associated NDs on Form 1's.	No.
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	Yes.
Is there one serial dilution per 20 samples? Flag all data reported with an "E" as "J".	Yes.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	ICV recoveries were acceptable.
Spot check CCV 90-110% or 80-120% for mercury. Contact lab if unacceptable.	CCV recoveries were acceptable.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. Samples MW-59S-SP15 and MW-58S-SP15 were dilute by 5X due to the nature of the matrix. Elevated reporting limits are provided.
Do field duplicate results show good precision for all compounds (see Table 7)?	N/A Nickel analysis was not requested in the field duplicate samples.

Total U Analysis by KPA	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? See Table 2	No.
Were any analytes flagged for blank contamination? See Table 2A *For samples, if results are <5 times the blank or <10 times blank then "U" flag data.*	No.

Data Usability Summary Report	Project: Sylvania: Monitoring Well: SP15
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total U Analysis by KPA	
Description	**Notes and Qualifiers**
LCS within QC criteria (75-125% recovery)? See Table 5 *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Kinetic Phosphorescence (75-125% recovery, RPD ± 20)? See Table 4 *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Do field duplicate results show good precision? See Table 7	N/A -- Field duplicate samples were not analyzed in this SDG for total U.
Were any samples re-analyzed or diluted? See Table 6. *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	Yes. Several samples were re-analyzed with a post-spike to test for quenching and then reanalyzed due to LCS noncompliance; only one result was reported per sample and no qualifiers were required.
Were all samples run under acceptable calibration?	Yes.

Summary of Potential Impacts on Data Usability
8260B • Acetone was detected in the TRIP BLANK 06. Low level acetone results in samples MW-215-39S-SP15 and MW-216-510-SP15 were U qualified as non-detect. • Surrogate recoveries were exceeded control limits in samples MW-59S-SP15, MW-215-395-SP15, MW-58S-SP15, MW-904-SP15, and MW-217-490-SP15. The positive detections were qualified J as estimated. • MW-219-560-SP15, MW-220-325-SP15, and MW-904-SP15 were initially analyzed at dilutions. Elevated reporting limits are provided for non-detect analytes. This may impact data comparability. 6010B • MW-59S-SP15 and MW-58S-SP15 were dilute due to the nature of the matrix. Elevated reporting limits are provided. This may impact data comparability.

General Sample Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	No. The laboratory mistakenly logged in the samples with "2" instead of "Z". A revision to the laboratory report 160-9202-1 was issued. The sample names were changed from "F" to "G" per the project manager since "F" samples had already been collected. Volatile organic analysis (VOA) was not performed on sample DRYH-F-Z8 due to laboratory login error. The laboratory received the samples; however, they did not log them in for analysis.
Did coolers arrive at lab between 2 and 6^{o}C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.
Frequency of Field QC Samples Correct? Field Duplicate - 1/20 samples Trip Blank - Every cooler with VOCs waters only Equipment Blank - 1/ set of samples per day?	No. 1 field duplicate per 10 samples 1 MS/MSD per 10 samples – The MS/MSD was collected by the field team, but not logged in by the laboratory. Trip Blanks were not included in the sample coolers for VOA. Rinsate blank RB-06 collected the day after sampling.
Case narrative present and complete?	Yes.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

General Sample Information	
Any holding time violations?	Yes. The following samples were re-extracted and analyzed outside of hold time for mercury analysis by Method 7471B. The laboratory noted a software malfunction resulting in the loss of initial data results. DRYH-F-Z3 DRYH-F-Z4 DRYH-F-Z5 DRYH-F-Z501 DRYH-F-Z6 DRYH-F-Z7 DRYH-F-EAST DRYH-F-NORTH DRYH-F-WEST-1 DRYH-F-WEST-2 The positive detections were qualified J- as estimated with a low bias. The non-detect results were qualified UR as rejected non-detect.

The following tables are presented at the end of this DUSR and provide summaries of results outside QC criteria:

- Method Blanks Results (Table 2)
- Surrogates Outside Limits (Table 3)
- MS/MSD Outside Limits (Table 4)
- LCS Outside Limits (Table 5)
- Reanalysis Results (Table 6)
- Field Duplicate Results (Table 7)

Go to Tables List

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	Yes. 2-Hexanone, Acetone, Methyl Ethyl Ketone (2-Butanone), and Methylene Chloride were detected in rinsate blank.
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	Five (5) samples were U qualified for acetone detection in the RB, One (1) sample was U qualified for Methyl Ethyl Ketone (2-Butanone) detection in the RB, and four (4) samples were U qualified for methylene chloride detection in the RB (acetone and methylene chloride are common laboratory contaminants).
Are surrogates for method blanks and LCS within limits?	Yes.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	No. The following samples had two (2) surrogate recoveries that were outside of control limits: DRYH-F-WEST-2 (low level), DRYH-F-EAST (medium level), and DRYH-F-NORTH (medium level). The following samples had four (4) surrogate recoveries that were outside of control limits: DRYH-F-WEST-2 (medium level) and DRYH-F-Z4 (medium level). The results in each sample were qualified J/UJ as estimated.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then "J" flag positive data in original sample due to matrix.	Sample DRYH-F-Z8 was submitted for MS/MSD analysis; however, the laboratory did not login the sample by mistake. A MS/MSD was not performed with batch 156421 or 157148; however, a LCS and LCSD were performed.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	No. The following analytes failed recovery low in the LCS/LCSD associated with batch 157148: chloroethane, chloromethane, cyclohexane, dichlorodifluoromethane, methylcyclohexane, trichlorofluoromethane, and vinyl chloride. All of the analytes except vinyl chloride are poor performing compounds in a multi-parameter spike. The associated results were all non-detect for all the analytes except methylcyclohexane. The results were qualified J/UJ as estimated. Trichlorofluoromethane exhibited poor precision between the LCS and LCSD. The results were qualified UJ due to recovery failures.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix (see Table 6)?	No. DCB was recovered low in sample DRYH-F-WEST-2. The results were already qualified J/UJ for surrogate failures.
Is initial calibration for target compounds <15% RSD or curve fit?	No. The following analytes were recovered greater than 15% in the initial calibration. Ethanol %RSD 32.0% Isopropyl Alcohol 21.0% Acetonitrile 23.0% 1,4-Dioxane 31.0% Ethanol, isopropyl alcohol and acetonitrile were not compounds of concern and no reported for the samples. 1,4-Dioxane was not detected in any of the samples; therefore, no qualification of the data was made.
Is continuing calibration for target compounds < 20.5% D.	Dichlorodifluoromethane exhibited %D of 22.5% D in CCV 160-156421/3. Acetone exhibited a %D of 23.3 in CCV 160-157423/3.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
	Trichlorofluoromethane and 2-hexanone exhibited %D of 26.9 and 30.6% respectively in CCV 160-157148/3. The sample results associated with each CCV were non-detect for the analytes exceeding control limits.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Samples DRYH-F-Z4, DRYH-F-EAST, DRYH-F-NORTH, and DRYH-F-WEST-1 were analyzed and reported at medium level due to high concentrations of target analytes and matrix interferences. Sample DRYH-F-WEST-2 was analyzed at low and medium level; however, only acetone, Dibromochloromethane and tetrachloroethane were reported from the medium level analysis.
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	Yes. Several metals were detected in the method blanks associated with the samples. Additionally, detections of metals were found in the ICB and CCB associated with the samples. Iron, Lead, Selenium, Vanadium, and Zinc were detected in the rinsate blank.
For samples, if results are < 5 times the blank then "U" flag data.	Beryllium was non-detect in the samples; therefore, no qualification of the data was required. Sample results for nickel, calcium and zinc were greater than 5X the laboratory blank detection; therefore, no qualification of the data was required. In the following instances, the sample results were less than 5X the blank detection and qualified U as non-detect. The sample results were less than the PQL; therefore, the detection limit updated to the sample result. Two (2) samples were U qualified for selenium detection in the CCB. Five (5) samples were U qualified for silver detections in the ICB or CCB. Two (2) samples were U qualified for lead detection in the RB, One (1) sample was U qualified for selenium detection in the RB, Seven (7) samples were U qualified for vanadium detection in the RB, and five (5) samples were U qualified for zinc in the RB.
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	No. Most of the analytes failed recovery in the MS/MSD of DRYH-F-WEST-1. The matrix was noted to be oily; therefore, matrix interference was present. Four (4) analytes were outside of controls limits in the MS/MSD of DRYH-F-Z8. The MSD was outside of control limits for mercury in sample DRYH-F-EAST. The laboratory noted that this sample was non-homogeneous mixture of oily, dirt-covered rocks; therefore matrix interference was present. The analytes were qualified J as estimated if the MS/MSD recovery was high or low, but the post digestion spike (PDS) was ≥75%. If the MS/MSD/PDS recoveries were all low, the analyte was qualified J- as estimated with a low bias. If the analyte was not detected in the parent sample and the MS/MSD/PDS recoveries were low, then the analyte was qualified UR as rejected. However, if the PDS recovery was acceptable, then the analyte was qualified UJ as estimated non-detect.
Were elements recovered ≤30%? If so, “R” flag associated NDs on Form 1's.	No.
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	Yes.
Is there one serial dilution per 20 samples? Flag all data reported with an “E” as “J”.	The serial dilution for sample DRYH-G-WEST-1 was greater than 15% for aluminum, arsenic, barium, cadmium, calcium, chromium, cobalt, copper, iron, lead, manganese, nickel, silver, and zinc. The sample matrix was noted as oily indicating matrix interference. No qualification of the data was made regarding the serial dilution exceedances; however, most of the analytes were previously qualified for MS/MSD failures.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	Calcium, chromium, cobalt, lead, nickel, and thallium were recovered between 106-107% in the ICV 160-163725/18. EPA Region 2 SOP HW-2a allows 90-110% of true value to be acceptable. No qualification of the data was made.
Spot check CCV 90-110% or 80-120% for mercury. Contact lab if unacceptable.	CCV’s were acceptable.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. All of the samples were diluted for analysis by Method 6010B due to the nature of the matrix. Each sample reported non-detect results at elevated reporting limits, which may impact data usability. Two (2) samples were diluted for analysis by Method 7471B to bring the concentration of target analytes within calibration range. There is no impact to data usability.
Do field duplicate results show good precision for all compounds (see Table 7)?	One of the field duplicate results was less than 5X PQL for both chromium and aluminum; therefore, the results were not qualified. Iron exhibited poor precision in the field duplicate samples and was J qualified as estimated.

Isotopic Uranium by ICP/MS	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	
For samples, if results are < 5 times the blank then "U" flag data.	
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	No. The MS/MSD recoveries for U-236 were low in sample DRYH-F-WEST-1. A PDS was not performed. The results were qualified J- as estimated with a low bias.
Were elements recovered ≤30%? If so, “R” flag associated NDs on Form 1's.	No.
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	Yes.
Is there one serial dilution per 20 samples? Flag all data reported with an “E” as “J”.	The serial dilution results were acceptable.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	Uranium-236 was recovered at 92% in the ICV 160-163726/9, and uranium-234 was recovered at 109% in ICV 160-164183/8. EPA Region 2 SOP HW-2b allows 90-110% of true value to be acceptable. No qualification of the data was made.
Spot check CCV 90-110%. Contact lab if unacceptable.	CCV’s were acceptable.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Isotopic Uranium by ICP/MS	
Description	**Notes and Qualifiers**
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. All of the samples were diluted for analysis by Method 6020A due to the nature of the matrix. The following samples reported non-detect results at elevated reporting limits, which may impact data usability: DRYH-F-WEST-2, DRYH-F-Z3, DRYH-F-Z5, DRYH-F-Z501, DRYH-F-Z6, DRYH-F-Z7.
Do field duplicate results show good precision for all compounds (see Table 7)?	One of the field duplicate results was less than 5X PQL for U-238. The results were not qualified.

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	Yes. Th-230 was detected in both method blanks above the uncertainty or MDC but below the PQL.
Were any analytes flagged for blank contamination? See Table 2A. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No. All sample results that were <5 times the blank concentration passed the USACE NAD test; therefore, no qualifiers were added.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Alpha Spectroscopy (70-130% recovery, RPD ± 35)? *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision for all isotopes? *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	Yes.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were background and continuing calibration checks (pulsers) performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check calculations, qualify per USACE guidance.*	No.
Were tracer yields within limits (QAPP: 50-100%, lab 30-110%)? *If recoveries were outside laboratory derived limits, but within default limits of 20-150%, flag associated results as estimated (J) after corrective actions; otherwise R. If recoveries are <20%: flag as rejected (R) and >150% rejected (R).*	Yes.
If recoveries were outside control limits, were adequate quantities of tracers used and were calculations correct? *Evaluate entire SDG for systematic errors and qualify if needed*	N/A: All recoveries were within limits.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Radium-226 and Other Gamma Emitters by Gamma Spectrometry

Description	Notes and Qualifiers
Any holding time violations?	No.
Any compounds present in method and field blanks? (See Table 2.) *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	No.
Were any analytes flagged for blank contamination? (See Table 2A.) *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.
Do field duplicate results show good precision for all isotopes? (See Table 7.) *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	No. K-40 results for the field duplicate sample pair were qualified with J/UJ due to field duplicate precision.
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were the samples prepared in sealed containers and subjected to a 21-day ingrowth period prior to analysis? *If not comparable, qualify results with J.*	Yes.
Was the soil matrix density comparable to the calibration standard density? (70-130%) *If not comparable, qualify Ra-226 results with J.*	Yes.
Were background and continuing calibration checks performed daily?	Yes.

Radium-226 and Other Gamma Emitters by Gamma Spectrometry	
Description	**Notes and Qualifiers**
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies in Ra-226 or Ra-228 daughters found? *If found, check spectra and calculations.*	No.
Spot check the raw data; were any anomalies found in other identified radionuclides? *If found, check spectra and calculations.*	No.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Compliance Review Total Uranium by KPA Analysis Approval by Data Validation Chemist	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	No.
Were any analytes flagged for blank contamination? See Table 2A. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	No.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.

Summary of Potential Impacts on Data Usability

8260B

- A trip blank was not provided in the coolers with samples for volatiles analysis.
- Several sample results were U qualified due to rinsate blank contamination.
- Due to matrix interferences, surrogate recoveries were below control limits for the following samples: DRYH-F-WEST-2, DRYH-F-EAST, DRYH-F-NORTH, AND DRYH-F-Z4. The results were qualified J/UJ as estimated. There was insufficient sample quantity for further analysis.
- The internal standard DCB was recovered low in sample DRY-F-WEST-2. The sample results were already qualified J/UJ for surrogate failures. There was insufficient sample quantity available to re-analyze the sample, and the failures are likely due to the nature of the matrix.
- The following samples were run at medium level due to high concentrations of target analytes and sample matrix issues: DRYH-F-Z4, DRYH-F-EAST, DRYH-F-NORTH, and DRYH-F-WEST-1. Elevated reporting limits were provided. It was noted in the narrative that all of the samples were initially analyzed as low level soil samples; however, due to internal standard and surrogate failures, the laboratory only reported the medium level results. This may impact data comparability.
- The laboratory did not login sample DRYH-F-Z8 for volatiles analysis. Extra volume was provided for MS/MSD analysis for this sample. Therefore, volatiles results are not available for this sample and a MS/MSD was not performed in the associated analysis batch.
- The following analytes failed recovery low in the LCS/LCSD associated with batch 157148: chloroethane, chloromethane, cyclohexane, dichlorodifluoromethane, methylcyclohexane, trichlorofluoromethane, and vinyl chloride. All of the analytes except vinyl chloride are poor performing compounds in a multi-parameter spike. The associated results were all non-detect for all the analytes except methylcyclohexane. The results were qualified J/UJ as estimated.

6010B

- Many of the sample digestates were oily with a high viscosity which resulted in the laboratory performing dilutions on them prior to analysis.
- Several sample results were U qualified due to rinsate blank contamination.
- Sample results were qualified as estimated and estimated non-detect due to failures associated with the MS/MSD. Thallium results for sample DRYH-F-WEST-1 were rejected due to 0% recoveries in the MS/MSD and low PDS recovery.
- Calcium was qualified as estimated due to poor precision in the field duplicate samples of DRYH-F-Z6.

7471B

- Due to software problems, the initial results for mercury were lost by the laboratory. The samples were re-extracted outside of hold time. The positive results were qualified J- as estimated with a low bias. The non-detect results were qualified UR as rejected.

6020A

- The MS/MSD recoveries for U-236 in sample DRYH-F-WEST-1 were below acceptance criteria. The results were qualified J- was estimated with a low bias.
- The sample results were diluted prior to analysis due to the nature of the matrix. The following samples had non-detect values and are reported with elevated reporting limits: DRYH-F-WEST-2, DRYH-F-Z3, DRYH-F-Z5, DRYH-F-Z501, DRYH-F-Z6, DRYH-F-Z7.

A-01-R

- There is no valid value for EPAR2 for the analytical method A-01-R; therefore the EDD does not pass the EDP check.

GA-01-R

- The field duplicate precision was outside acceptance criteria for K-40; therefore, the K-40 results for the field duplicate sample pair were qualified with J/UJ as estimated.
- The valid value for EPAR2 for the analytical method is EML GA-01-R; therefore the EDD references EML GA-01-R instead of GA-01-R for these analyses.

Table 6 –Samples that were Re-analyzed

Sample ID	Lab ID	Method	Sample Type	Action
DRYH-F-EAST	160-9202-3	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for beryllium, potassium, and thallium.
DRYH-F-NORTH	160-9202-4	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for beryllium, potassium, and thallium.
DRYH-F-WEST-1	160-9202-2	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for beryllium, potassium, and thallium.
DRYH-F-WEST-2	160-9202-5	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for antimony, beryllium, potassium, sodium, thallium, and vanadium.
DRYH-F-Z3	160-9202-6	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for arsenic, antimony, beryllium, cadmium, lead, potassium, sodium, thallium, selenium.
DRYH-F-Z4	160-9202-7	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for beryllium, potassium, and thallium.

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Sample ID	Lab ID	Method	Sample Type	Action
DRYH-F-Z5	160-9202-8	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for antimony, beryllium, calcium, cadmium, cobalt, lead, potassium, sodium, thallium, and vanadium.
DRYH-F-Z501	160-9202-1	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for antimony, arsenic, beryllium, calcium, cadmium, copper, lead, nickel, potassium, sodium, thallium, vanadium, and zinc.
DRYH-F-Z6	160-9202-9	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for antimony, beryllium, calcium, cadmium, lead, potassium, selenium, sodium, thallium, and vanadium.
DRYH-F-Z7	160-9202-10	SW6010B	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for antimony, beryllium, calcium, cadmium, copper, potassium, selenium, sodium, and thallium.
DRYH-F-Z8	160-9245-1	SW6010B	SO	10X: Dilute to bring the concentration of target analytes within the calibration range. Elevated reporting limits provided for antimony, beryllium, cadmium, potassium, selenium, sodium and thallium.
DRYH-F-EAST	160-9202-3	SW6020A	SO	10X: Diluted due to the oily nature of the matrix. No impact to data usability.
DRYH-F-NORTH	160-9202-4	SW6020A	SO	10X: Diluted due to the nature of the matrix. No impact to data usability.
DRYH-F-WEST-1	160-9202-2	SW6020A	SO	10X: Diluted due to the oily nature of the matrix. No impact to data usability.
DRYH-F-WEST-2	160-9202-5	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-236.
DRYH-F-Z3	160-9202-6	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-234 and U-236.
DRYH-F-Z4	160-9202-7	SW6020A	SO	10X: Diluted due to the nature of the matrix. No impact to data usability.
DRYH-F-Z5	160-9202-8	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-234, U-235, and U-236.
DRYH-F-Z501	160-9202-1	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-234, U-235, and U-236.

Sample ID	Lab ID	Method	Sample Type	Action
DRYH-F-Z6	160-9202-9	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-234, U-235, and U-236.
DRYH-F-Z7	160-9202-10	SW6020A	SO	10X: Diluted due to the nature of the matrix. Elevated reporting limits provided for U-234, U-235, and U-236.
DRYH-F-Z8	160-9245-1	SW6020A	SO	10X: Dilute due to the abundance of non-target analytes. The samples were noted to be high in salts, which cause internal standard and instrument failure. Elevated reporting limits provided.
DRYH-F-EAST	160-9202-3	SW7471	SO	10X: Diluted to bring the concentration of target analytes within the calibration range. No impact to data usability.
DRYH-F-WEST-1	160-9202-2	SW7471	SO	10X: Diluted to bring the concentration of target analytes within the calibration range. No impact to data usability.

Acronym List and Table Key:

CCV = continuing calibration verification
COC = chain of custody
DUSR = data usability summary report
GC/MS = gas chromatography / mass spectrometry
LCS = laboratory control sample
MBLK = method blank
MS = matrix spike
MSD = matrix spike duplicate
NYSDEC = New York State Department of Environmental Conservation

Data Usability Summary Report	Project: Sylvania: Dry Well Samples
Date Completed: June 10, 2016	Completed by: Lynne Kalmbach and Joanna Christopher

Acronym List and Table Key:

PQL	=	practical quantitation limit
QA	=	quality assurance
QAPP	=	quality assurance project plan
QC	=	quality control
RPD	=	relative percent difference
SDG	=	sample delivery group
TIC	=	tentatively identified compound
VOC	=	volatile organic compound

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

The analytical data provided by the laboratory were reviewed for precision, accuracy, and completeness based on applicable sections of the following guidelines.

- NYSDEC Division of Environmental Remediation Guidance for Data Deliverables and the Development of Data Usability Summary Reports (in DER-10, May 2010)
- EPA Region 2 Data Validation SOPs
- Department of Defense (DoD) Quality Systems Manual for Environmental Laboratories Version 5.0
- USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy, Revision 01

Specific criteria for QC limits were obtained from the project specific QAPP. Compliance with the project QA program is indicated in the checklist and tables below. Any major or minor concerns affecting data usability are listed below. The checklist and tables also indicate whether data qualification is required and/or the type of qualifier assigned.

General Sample Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	No. Two of the coolers associated with SDG 160-8643-1 were received at 0.9°C and 1.2°C. There laboratory did not indicate any evidence of the samples freezing.
Frequency of Field QC Samples Correct? Field Duplicate - 1/20 samples Trip Blank - Every cooler with VOCs waters only Equipment Blank - 1/ set of samples per day?	No. 2 field duplicate per 19 samples 1 MS/MSD per 19 samples Trip Blanks were not included in the sample coolers for VOA. Rinsate blank not required.
Case narrative present and complete?	Yes.
Any holding time violations?	No.

The following tables are presented at the end of this DUSR and provide summaries of results outside QC criteria:

- Method Blanks Results (Table 2)
- Surrogates Outside Limits (Table 3)
- MS/MSD Outside Limits (Table 4)
- LCS Outside Limits (Table 5)
- Reanalysis Results (Table 6)
- Field Duplicate Results (Table 7)

Go to Tables List

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	No.
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	No qualifications required.
Are surrogates for method blanks and LCS within limits?	Yes.
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	No. Two surrogate recoveries exceeded the control limits for STB-02-Z1. The samples results were qualified J/UJ as estimated.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then “J” flag positive data in original sample due to matrix.	Yes.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	Yes.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix (see Table 6)?	No. DCB and CBZ were recovered low in sample STB-02-Z1. The sample results were already qualified as estimated due to surrogate failures.
Is initial calibration for target compounds <15% RSD or curve fit?	No. The following analytes exhibited an RSD greater than 15% and were not curve fit in the initial calibration. Ethanol 48.8% RSD Ethyl Acetate 22.1% RSD Trans-1,4-dichloro-2-butene 15.2% RSD These analytes were not compounds of concern and not reported for the samples.
Is continuing calibration for target compounds < 20.5% D.	Dichlorodifluoromethane exhibited %D of 22.6% and chloromethane exhibited a %D 26.2 in CCV 160-148061/3. The analytes are poor performing compounds in a multi-parameter spike and EPA SOP HW-33 Rev3 allows up to 40% D for poor performers. The associated sample results were non-detect and no qualification of data was made.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Sample STB-02-Z1 was analyzed at medium level for tetrachloroethene and trichloroethene due to high concentration values. All other analytes are reported from the low level.
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	Yes. Several metals were detected in the method blanks associated with the samples. Additionally, detections of metals were found in the ICB and CCB associated with the samples.
For samples, if results are < 5 times the blank then "U" flag data.	Selenium, beryllium, and cadmium were all non-detect in the samples; therefore, no qualification of the data was required. Sample results for calcium and iron were greater than 5X the blank detection; therefore, no qualification of the data was required. In the following instances, the sample results were less than 5X the blank detection and qualified U as non-detect. The sample results were less than the PQL; therefore, the detection limit updated to the sample result. Two (2) samples were U qualified for zinc detection in the method blank. Eighteen (18) samples were U qualified for lead detections in the ICB or CCB. Seven (7) samples were U qualified for copper detections in the CCB.
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	No. Aluminum was recovered high in the MS and MSDs for samples STB-01-Z8 and STB-02-Z8. The post digestion spike (PDS) was acceptable; therefore, the results in the parent sample were qualified J as estimated.
Were elements recovered ≤30%? If so, “R” flag associated NDs on Form 1's.	No.
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	Yes.
Is there one serial dilution per 20 samples? Flag all data reported with an “E” as “J”.	The serial dilutions were acceptable.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	ICV’s were acceptable.
Spot check CCV 90-110% or 80-120% for mercury. Contact lab if unacceptable.	CCV’s were acceptable.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. All of the samples were diluted for analysis by Method 6010B due to the nature of the matrix. The laboratory noted that all of the digestates were yellow in color. Each sample reported non-detect results at elevated reporting limits, which may impact data usability.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision for all compounds (see Table 7)?	Yes.

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Any holding time violations?	No
Any compounds present in method and field blanks? See Table 2. *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	Yes. Th-228 and Th-230 were detected in method blanks above the uncertainty or MDC but below the PQL.
Were any analytes flagged for blank contamination? See Table 2A. *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	Yes. Some (not all) sample results that were <5 times the blank concentration passed the USACE NAD test; therefore, J/UJ qualifiers were added as applicable.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes.
MS/MSD within QC criteria for Alpha Spectroscopy (70-130% recovery, RPD ± 35)? *If out and LCS is compliant, then J flag positive data in original sample due to matrix.*	Yes.
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.

Isotopic Thorium and Uranium by Alpha Spectrometry	
Description	**Notes and Qualifiers**
Do field duplicate results show good precision for all isotopes? *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	No. Th-230, Th-232, and U-238 results for the field duplicate sample pairs were qualified with UJ due to field duplicate precision (all field duplicate sample pair results were <MDC).
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were background and continuing calibration checks (pulsers) performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies found in spectra? *If found check calculations, qualify per USACE guidance.*	No.
Were tracer yields within limits (QAPP: 50-100%, lab 30-110%)? *If recoveries were outside laboratory derived limits, but within default limits of 20-150%, flag associated results as estimated (J) after corrective actions; otherwise R. If recoveries are <20%: flag as rejected (R) and >150% rejected (R).*	Yes.
If recoveries were outside control limits, were adequate quantities of tracers used and were calculations correct? *Evaluate entire SDG for systematic errors and qualify if needed*	N/A: All recoveries were within limits.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Radium-226 and Other Gamma Emitters by Gamma Spectrometry	
Description	**Notes and Qualifiers**
Any holding time violations?	No.
Any compounds present in method and field blanks? (See Table 2.) *Method blank results should be less than ½ PQL, <MDC, and less than the uncertainty.*	Yes. Ra-226 was detected in a method blank above the uncertainty or MDC but below the PQL.
Were any analytes flagged for blank contamination? (See Table 2A.) *For samples, if results are <5 times the blank, apply the Normalized Absolute Difference test in USACE Guidance. Qualify as noted.*	Yes. Some (not all) sample results that were <5 times the blank concentration passed the USACE NAD test; therefore, J qualifiers were added as applicable.
LCS within QC criteria (70-130% recovery)? *If recoveries are between 50 and 150% then J-flag results. Reject data with recovery <50% or greater than 150%. High recoveries need to be flagged manually.*	Yes
Matrix duplicate within QC criteria (RPD ± 35, NAD < 1.96) ? *MD must be performed on site samples to use results for qualification. If out, apply the Normalized Absolute Difference* <1.96 *test in USACE Guidance. Qualify as noted.*	Yes.
Do field duplicate results show good precision for all isotopes? (See Table 7.) *For any sample with high RPDs (>70 for soil samples) evaluate the difference factor and apply professional judgment as noted in the USACE Guidance.*	No. K-40 results for one field duplicate sample pair and Ra-228 results for the other field duplicate sample pair were qualified with UJ due to field duplicate precision (all field duplicate sample pair results were <MDC).
Were any samples re-analyzed or diluted? *For any sample re-analysis and dilutions ensure that only one result per sample and analyte is flagged as reportable.*	No.
Were the samples prepared in sealed containers and subjected to a 21-day ingrowth period prior to analysis? *If not comparable, qualify results with J.*	Yes.
Was the soil matrix density comparable to the calibration standard density? (70-130%) *If not comparable, qualify Ra-226 results with J.*	Yes.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 28, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Radium-226 and Other Gamma Emitters by Gamma Spectrometry	
Description	**Notes and Qualifiers**
Were background and continuing calibration checks performed daily?	Yes.
Were instrument checks marked as failed and if so checks performed more than twice to bring into compliance? *Determine if project samples were impacted and qualify if necessary.*	No.
Spot check the raw data, were any anomalies in Ra-226 or Ra-228 daughters found? *If found, check spectra and calculations.*	No.
Spot check the raw data; were any anomalies found in other identified radionuclides? *If found, check spectra and calculations.*	No.
Were the relationships between results, uncertainties, and MDCs in compliance? *If not, refer to the USACE for guidance in qualification of results.*	Yes.

Summary of Potential Impacts on Data Usability

8260B

- A trip blank was not provided in the coolers with samples for volatiles analysis.
- Due to matrix interferences, surrogate recoveries were below control limits for sample STB-02-Z1. The results were qualified J/UJ as estimated.
- The internal standards DCB and CBZ were recovered low in sample STB-02-Z1. The sample results were already qualified J/UJ for surrogate failures.

6010B

- All of the sample digestates were noted to have a yellow color; therefore, they were all dilute prior to analysis. Each sample reports several analytes at elevated reporting limits.
- Aluminum was qualified J as estimated due to high recovery in the MS and MSD of samples STB-01-Z8 and STB-02-Z8.

A-01-R

- The field duplicate precision was outside acceptance criteria for several isotopes; therefore, the results for the field duplicate sample pairs were qualified with J/UJ as estimated.
- Thorium isotopes were detected in method blanks above the MDC or 2-sigma uncertainty and below the PQL. Sample results were qualified with J as applicable.
- There is no valid value for EPAR2 for the analytical method A-01-R; therefore the EDD does not pass the EDP check.

GA-01-R

- The field duplicate precision was outside acceptance criteria for K-40 and Ra-228; therefore, these results for the field duplicate sample pairs were qualified with UJ as estimated as applicable.
- Radium-226 was detected in a method blank above the MDC or 2-sigma uncertainty and below the PQL. Sample results were qualified with J as applicable.
- The valid value for EPAR2 for the analytical method is EML GA-01-R; therefore the EDD

Summary of Potential Impacts on Data Usability
references EML GA-01-R instead of GA-01-R for these analyses.

Acronym List and Table Key:

CCV = continuing calibration verification
COC = chain of custody
DUSR = data usability summary report
GC/MS = gas chromatography / mass spectrometry
LCS = laboratory control sample
MBLK = method blank
MS = matrix spike
MSD = matrix spike duplicate
NYSDEC = New York State Department of Environmental Conservation
PQL = practical quantitation limit
QA = quality assurance
QAPP = quality assurance project plan
QC = quality control
RPD = relative percent difference
SDG = sample delivery group
TIC = tentatively identified compound
VOC = volatile organic compound

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 30, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

The analytical data provided by the laboratory were reviewed for precision, accuracy, and completeness based on applicable sections of the following guidelines.

- NYSDEC Division of Environmental Remediation Guidance for Data Deliverables and the Development of Data Usability Summary Reports (in DER-10, May 2010)
- EPA Region 2 Data Validation SOPs
- Department of Defense (DoD) Quality Systems Manual for Environmental Laboratories Version 5.0

Specific criteria for QC limits were obtained from the project specific QAPP. Compliance with the project QA program is indicated in the checklist and tables below. Any major or minor concerns affecting data usability are listed below. The checklist and tables also indicate whether data qualification is required and/or the type of qualifier assigned.

160-4889-5	SL	SW6020A	Metals (ICP/MS)	4	N/FD

General Sample Information	
Do Samples and Analyses on COC check against Lab Sample Tracking Form?	Yes.
Did coolers arrive at lab between 2 and 6°C and in good condition as indicated on COC and Cooler Receipt Form?	Yes.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 30, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

General Sample Information	
Frequency of Field QC Samples Correct? Field Duplicate - 1/20 samples Trip Blank - Every cooler with VOCs waters only Equipment Blank - 1/ set of samples per day?	No. Field duplicate not collected. MS/MSD not collected. 1 Trip Blank per cooler with VOC samples. Rinsate blank not required.
Case narrative present and complete?	Yes.
Any holding time violations?	No.

The following tables are presented at the end of this DUSR and provide summaries of results outside QC criteria:

- Method Blanks Results (Table 2)
- Surrogates Outside Limits (Table 3)
- MS/MSD Outside Limits (Table 4)
- LCS Outside Limits (Table 5)
- Reanalysis Results (Table 6)
- Field Duplicate Results (Table 7)

Go to Tables List

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Any compounds present in method, trip, or, field blanks (see Table 2)?	Yes. Acetone was detected in MB 160-92576/2 and tetrachloroethene was detected in MB 160-92266/1-A.
For samples, if results are < 5 times the blank or < 10 times the blank for common laboratory contaminants, then "U" flag data.	The result for acetone in sample TB-01-FA13 was U qualified as non-detect due to method blank detections. The sample result was less than the PQL; therefore, the method detection limit was elevated to the sample result. The sample results for tetrachloroethene were all greater than 5X the blank detection; therefore, no qualification of the data was made.
Are surrogates for method blanks and LCS within limits?	Yes.
Are surrogates for samples and MS/MSD within limits? (See Table 3). If not, were all samples reanalyzed for VOCs?	No. Samples STS-01-FA13 and STS-801-FA13 were analyzed at a 20X and 1000X dilution; therefore, the surrogates were diluted out. No qualification of the data was made. Sample STS-02-FA13 had two surrogates recovered below control limits and STS-03-FA13 had four surrogates recovered below control limits. The laboratory performed a re-extraction and/or re-analysis and the results were duplicated; therefore, the failures are likely due to matrix interference. The sample results were qualified J/UJ as estimated.
Is Laboratory QC frequency at least one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.

Date Completed: April 30, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
Is MS/MSD within QC criteria (see Table 4)? If out and LCS is compliant, then "J" flag positive data in original sample due to matrix.	A MS/MSD was not included with the sample delivery group.
Is LCS within QC criteria (see Table 5)? If out, and the recovery is high with no positive values, then no data qualification is required.	Yes.
Do internal standards areas and retention time meet criteria? If not was sample re-analyzed to establish matrix (see Table 6)?	Yes.
Is initial calibration for target compounds <15% RSD or curve fit?	No. The following poor performing analytes exhibited a relative response factor (RRF) value less than the laboratory minimum criterion of 0.1000: acetone, methyl acetate, and 2-butanone. The RRF values were ≥0.0100; the allowance for poor performing analytes per EPA Region 2 SOP HW-33, Rev 3. The %RSD was acceptable and the associated results were non-detect for the analytes. No qualification of the data was made.
Is continuing calibration for target compounds < 20.5% D.	ICV: For ICV 160-90908/10, the following analytes were below the minimum RRF: acetone(0.0544), methyl acetate(0.0210), and 2-butanone(0.0698). Trans-1,3-dichloropropene exhibited a %D of 20.4. CCV: For CCV 160-92558/3, the following analytes were below the minimum RRF: Acetone(0.0459), methyl acetate(0.0229), and 2-butanone(0.0745). The following analytes exceeded 20% D: 2-butanone(20.8) and 4-methyl-pentanone(22.9). For CCV 160-92762/2, the following analytes were below the minimum RRF: Acetone(0.0370), methyl acetate(0.0196), and 2-butanone(0.0628). All of the analytes that failed ICV and CCV acceptance criteria are poor performing compounds with the exception of 1,3-dichloropropene. %D ≤ 40% and min RRF ≥0.010 are acceptable for poor performing compounds per EPA Region 2 SOP HW-33, Rev 3. For all other volatile compounds, the SOP allows up the 25% D. The analytes were not detected in the samples. No qualification of the data was made.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	All of the samples were analyzed at medium level due to high concentrations of target analytes. Samples STS-01-FA13 and STS-801-FA13 were initial run at a 20X dilution and then run at 1000X dilution to bring the concentrations of 1,1,1-trichloroethane, tetrachloroethene, and trichloroethene within calibration range.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 30, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Volatile Organics by GC/MS	
Description	**Notes and Qualifiers**
For TICs are there any system related compounds that should not be reported?	N/A
Do field duplicate results show good precision for all compounds (see Table 7)?	No. Tetrachloroethene exhibited poor precision in the field duplicate of STS-01-FA13. The results in both samples were qualified J as estimated.

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Are any compounds present in method and field blanks as noted on Table 2?	Yes. Selenium was detected in MB 160-94265/1-A, and vanadium was detected in CCBs 460-97021/84 and 160-97021/96.
For samples, if results are < 5 times the blank then "U" flag data.	Selenium was not detected in the samples; therefore, no qualification was required. Vanadium was detected in the samples bracketed by CCB 160-97021/96. The sample results were less than 5X the blank detection; therefore, the results were qualified U as non-detect. The sample results were less than the PQL; therefore, the detection limit was elevated to the sample result.
Is laboratory QC frequency one blank and LCS with each batch and one set of MS/MSD per 20 samples?	Yes.
Are MS/MSD within QC criteria (see Table 4)? QC limits are not applicable to sample results greater than 4 times spike amount. All N flagged data for MS are flagged J as estimated.	No. SW6010B: Aluminum was recovered <75% in the MSD. The post digestion spike (PDS) recovery was 75%, which is acceptable per EPA Region 2 SOP HW-2a, Rev 15. The result in the parent sample was qualified J as estimated. Barium was recovered >130% in the MS and <30% in the MSD. The PDS was acceptable; therefore, the result was qualified J. Chromium, manganese, and nickel were recovered below 75% in the MSD. The PDS recoveries were acceptable; therefore the results were J qualified. Lead was recovered <75% in the MSD. The PDS was acceptable; therefore, the result was qualified J as estimated. The MS and MSD recoveries for silver were below 30%. The PDS was acceptable; therefore, the results were qualified J as estimated. SW7471B: Sample STS-01-FA13 was used for laboratory QC. The native sample concentration was greater than 4X the spiking concentration. No qualification of the data was required.
Were elements recovered ≤30%? If so, “R” flag associated NDs on Form 1's.	No.

Data Usability Summary Report	Project: Sylvania: Septic Tank Borings
Date Completed: April 30, 2015	Completed by: Lynne Kalmbach and Joanna Christopher

Total Metals by ICP and Mercury by CCVA	
Description	**Notes and Qualifiers**
Is LCS within QC criteria (see Table 5)? If out, and the recovery high with no positive values, then no data qualification is required.	No. Potassium and sodium were recovered high in LCS 160-94265/2-A. Per EPA Region 2 SOP HW-2a, Rev 15, recovery up to 130% is acceptable. Potassium was recovered at 128%; and sodium was recovered at 131%. The analytes were not detected in any of the samples. No qualification of the data was made.
Is there one serial dilution per 20 samples? Flag all data reported with an "E" as "J".	The serial dilutions were acceptable.
Spot check ICS recoveries 80-120%. Contact lab if unacceptable.	ICS recoveries were acceptable.
Spot check ICV 95-105%. Contact lab if unacceptable.	ICV's were acceptable.
Spot check CCV 90-110% or 80-120% for mercury. Contact lab if unacceptable.	Sodium and potassium were recovered at 115% in CCV 160-97021/106. The sample results for the analytes were non-detect; therefore, no qualification of the data was required.
Were any samples reanalyzed or diluted (see Table 6)? For any sample reanalysis or dilutions, is only one reportable result flagged?	Yes. SW6010B: All of the samples were diluted for analysis by Method 6010B due to the nature of the matrix. Each sample reported non-detect results at elevated reporting limits, which may impact data usability. SW7174B: Samples STS-01-FA13 and STS-801-FA13 were diluted by 10X due to target analytes exceeding the calibration curve. No impact to data usability.
Do field duplicate results show good precision for all compounds (see Table 7)?	No. Chromium and iron exhibited poor precision between the parent sample and field duplicate. The results in STS-01-FA13 and STS-801-FA13 were qualified J as estimated.

Summary of Potential Impacts on Data Usability
8260B • Acetone and tetrachloroethene were detected in a method blank. • Acetone was detected in a trip blank and U qualified due to method blank contamination. • Sample STS-02-FA13 and STS-03-FA13 had surrogates recovered below control limits; the sample results were qualified J/UJ as estimated. • Tetrachloroethene in the field duplicate sample pair of STS-01-FA13 results were qualified J as estimated due to precision outside control limits. 6010B • Aluminum, barium, chromium, manganese, lead, nickel, and silver results in the parent sample were J qualified due to MS/MSD recoveries outside control limits. • Vanadium sample results were qualified with U as non-detect due to contamination detected in CCBs. • Chromium and iron results in field duplicate sample pair STS-01-FA13 and STS-801-FA13 were

qualified J as estimated due to poor precision.

- All of the samples were diluted due to the nature of the matrix. Each sample reported non-detect results at elevated reporting limits, which may impact data usability.

7471B:

- MS/MSD recoveries were outside control limits for sample STS-01-FA13; the native sample concentration was greater than 4X the spiking concentration and no qualification of the data was required.

DATA REVIEW MEMORANDUM

DATE: April 11, 2016

TO: Daniel Kennedy, Project Manager, E & E, Buffalo

FROM: Lynne Kalmbach, Chemist, E & E, Buffalo
Joanna Christopher, Senior Radiation Scientist, E & E, Buffalo

SUBJ: Data Review - Sylvania Vertical Profile Sampling

REFERENCE:

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included; however, rinsate blanks were included for each vertical profile boring. The samples for volatile organic analysis (VOA) were sent to American Analytical Laboratories, Farmingdale, NY for analysis. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed except that custody seals were not present on the coolers containing samples associated with the following sample delivery groups: 160-15675-1 and 1650-16269-1. The sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process. As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. Methylene chloride and acetone were detected in most of the method blanks as noted on Table 2. These analytes are common laboratory contaminants. Most of the sample results were less than 10X the blank detection and were qualified "U" as not detected as noted on Table 2A. If the sample result was greater was less than the PQL, the MDL was elevated to the sample result. If the sample result was greater than the PQL, then the PQL was elevated to the sample result.

The water used during drilling was analyzed for volatiles. Bromoform, dibromochloromethane, and toluene were common detections in the water. Bromoform and dibromochloromethane are common trihalomethanes formed from the chlorination of public drinking water. Tert-butyl methyl ether was detected in sample DW-222 below the PQL.

Tert-butyl methyl ether and toluene were detected in several samples.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a

laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD) between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. The results in the parent sample was qualified J as estimated for spike recoveries that were outside of acceptance criteria. If the spike was recovered low and the result was non-detect in the parent sample, then the result was qualified UJ as estimated non-detect. No qualification of the data was made when the native sample concentration was greater than 4X the spiking concentration or if the spike recovery was high and the sample result was non-detect. For sample MW-222-VP36, the MS recovery for chloroethane was within acceptance limits and the MSD recovery was 0%; therefore, the RPD also was outside acceptance limits (it appears that the sample was not spiked for this compound). The chloroethane sample result for sample MW-222-VP36 was qualified with UJ as estimated non-detect.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

Several samples were diluted due to analytes exceeding the calibration curve for volatiles analysis as presented in Table 6. Only the analyte exceeding the calibration curve was reported from the dilution.

Several compounds (1,2-DIBROMO-3-CHLOROPROPANE, 2-BUTANONE, ACETONE, BROMOFORM, DIBROMOCHLOROMETHANE, DICHLORODIFLUOROMETHANE, METHYL TERT-BUTYL ETHER, and METHYLENE CHLORIDE) exhibited a % D greater than 20% in the calibration in several analytical batches. Since these are not compounds of concern for this work, the results were reported with J qualification as estimated (UJ for estimated nondetect).

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were collected for an overall project frequency of 10%: 10 field duplicates per 98 samples. The RPD ratings are listed on Table 7 as “Good” if the RPD is less than 40% and as “Poor” if the RPD exceeded 40%. Field duplicate results with “Poor” are

flagged “J” as estimated. No qualification of the data was made for analytes exhibiting poor precision where at least one of the sample results was less than the PQL. The sample results for acetone and methylene chloride were qualified U as non-detect due to method blank contamination.

1,1-DICHLOROETHANE and TETRACHLOROETHENE were qualified with J in the field duplicate sample pair MW-224-VP22/MW-224-VP901 due to poor precision.

DATA REVIEW MEMORANDUM

DATE: February 27, 2015

TO: Daniel Kennedy, Project Manager, E & E, Buffalo

FROM: Lynne Kalmbach, Chemist, E & E, Buffalo
Joanna Christopher, Senior Radiation Scientist, E & E, Buffalo

SUBJ: Data Review - Sylvania Vertical Profile Sampling

REFERENCE:

I. SAMPLE IDENTIFICATION

For the sampling activities for the Sylvania Vertical Profile Sampling project, Ecology and Environment, Inc. (E & E) collected the samples listed on Table 1. The samples were analyzed for methods listed below. Matrix spike/matrix spike duplicates (MS/MSD) were designated in the field. Trip blanks were not included; however, rinsate blanks were included for each vertical profile boring. The samples for volatile organic analysis (VOA) were sent to American Analytical Laboratories, Farmingdale, NY for analysis, and the samples for total uranium was sent to GEL, Charleston, SC. All other tables are included at the end of this memorandum.

Data were reviewed for field and laboratory precision, accuracy, and completeness in accordance with procedures and quality control (QC) limits. Laboratory data qualifiers for compound identification and quantitation were accepted. Any additional data review qualifiers added are noted below and listed on the tables at the end of this memorandum. Definitions of all data qualifiers are given in the report.

II. SAMPLE PROCEDURES

All samples were collected as specified in the work plan and documented on the chain-of-custody (COC). Samples were analyzed as specified on the COC. Samples were packaged, shipped and received as specified in the work plan. All samples must be received cold (4 +/-2) ^{o}C and in good condition as documented on the Cooler Receipt Form.

REVIEW RESULTS:

All sample procedures were followed except that custody seals were not present on the samples associated with the following sample delivery groups: 160-8223-1, 160-8269-1, 160-8278-1, 160-8363-1, and 160-8745-1. The sample coolers were received at the appropriate temperatures.

III. LABORATORY DATA

1.0 HOLDING TIMES

Holding times are established and monitored to ensure analytical results accurately represent analyte concentrations in a sample at the time of collection. Exceeding the holding time for a sample generally results in a loss of the analyte due to a variety of mechanisms, such as deposition on the sample container walls or precipitation.

REVIEW RESULTS:

All samples were analyzed within the project-specified holding time.

Go to Tables **List**

2.0 BLANKS

Laboratory and field blank samples are analyzed and evaluated to determine the existence and magnitude of possible contamination during the sampling and analysis process.

As noted in Table 2 (if applicable), analyte concentrations in the blanks are generally below the practical quantitation limit (PQL). If the analyte is present in the sample at similar trace levels, then the analyte is likely a common background contaminant from some phase of the sampling, extraction, or analytical procedure and associated low level sample concentrations are not considered to be site related. If the analyte concentration is above the PQL, then there is a potential contamination problem and sample results may be biased high or the data unusable.

REVIEW RESULTS:

All blanks were performed at the required frequency. Methylene chloride and acetone were detected in most of the method blanks as noted on Table 2. These analytes are common laboratory contaminants. Most of the sample results were less than 10X the blank detection and were qualified "U" as not detected as noted on Table 2A. If the sample result was greater was less than the PQL, the MDL was elevated to the sample result. If the sample result was greater than the PQL, then the PQL was elevated to the sample result. 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene were detected in one method blank. One sample was U qualified for these analytes due to the results being less than 5X the blank detections.

Arsenic, calcium, selenium and zinc were detected in the method blanks for Method SW6010B. Several sample results that were less than 5X the blank detection were U qualified as non-detect.

Several rinsate blanks had volatiles and metals detections as noted on Table 2. Results associated with these rinsate blanks were qualified U as non-detect as noted on Table 2B.

Total uranium was detected above the reporting limit in one rinsate blank as noted on Table 2. Associated sample results did not require qualification.

The water used during drilling was analyzed for volatiles. Acetone, methylene chloride, bromoform and dibromochloromethane were common detections in the water. Acetone and methylene chloride are likely lab related contamination. Bromoform and dibromochloromethane are common trihalomethanes formed from the chlorination of public drinking water. Bromoform was detected in two groundwater samples: MW-217-VP39 and MW-220-VP40. It is possible that the drill water was sampled in these instances rather than the actual groundwater. The samples collected above and below the sample MW-220-VP40 have detections of benzene, PCE, and toluene that are not present in the sample itself. However, the results for MW-217-VP39 are similar to the samples taken above and below it with all the analyte results being non-detect.

Trichloroethylene (TCE) was also detected in the drill water, which initiated a work stoppage and investigation to the source of contamination. The draft memorandum *Sylvania Corning FUSRAP – Drill Water TCE Summary* dated October 7, 2014(revised January 12, 2015) details the investigation of the source of TCE. The drill water contained trace levels of trihalomethanes which were generally not present in the groundwater samples; therefore, it is likely that the drill water was not inadvertently sampled during the vertical profile sampling. The TCE contaminated drill water would not have impacted data usability.

3.0 SURROGATE SPIKE RECOVERY

Laboratory performance for individual samples analyzed for organic compounds is established by means of surrogate spiking activities. Samples are spiked with surrogate compounds prior to preparation and analysis. Unusually low or high surrogate recovery values may indicate some deficiency in the analytical system or that some matrix effects exist, resulting in low or high sample results for target compounds. Sample surrogate recoveries outside QC limits (if applicable) are presented in Table 3.

REVIEW RESULTS:

Surrogate spikes were appropriately added to all field and QC samples. Recoveries were within laboratory QC limits except for those listed in Table 3. Two samples and one method blank exhibited poor recovery of dibromofluoromethane. No action was taken for one surrogate outside criteria.

4.0 MATRIX SPIKE AND MATRIX SPIKE DUPLICATE ANALYSIS

The matrix spike and matrix spike duplicate (MS/MSD) analyses are intended to provide information about the effects that the sample matrix exerts on the digestion/extraction and measurement methodology. MS recovery values that do not meet laboratory QC criteria may indicate that sample analyte results are being attenuated in the analysis procedure. These results are presented in Table 4 (if applicable). The potential sample bias may be estimated by noting the degree to which the MS concentration was elevated or lowered in the spike analysis. However, this bias should serve only as approximations; sample-specific problems may be the cause of the discrepancy, particularly in soil samples. Recoveries of a post-digestion spike or a laboratory control sample (LCS) are used to verify that the analytical methodology is acceptable and that MS recoveries are due to matrix effects. An MSD analysis is performed to evaluate the precision of the sample results. Precision is measured as the relative percent difference (RPD)

between analytical results for duplicate samples. The laboratory's failure to produce similar results for MSD samples may indicate that the samples were non-homogeneous (particularly in soil samples), or that method defects may exist in the laboratory's techniques.

REVIEW RESULTS:

The MS/MSD sample analyses were performed at the required frequency. The recovery and RPD results were within QC criteria established except as noted on Table 4. For organic analyses, only the parent sample results are qualified based on MS/MSD outliers. The results in the parent sample was qualified J as estimated for spike recoveries that were outside of acceptance criteria. If the spike was recovered low and the result was non-detect in the parent sample, then the result was qualified UJ as estimated non-detect. No qualification of the data was made when the native sample concentration was greater than 4X the spiking concentration or if the spike recovery was high and the sample result was non-detect. Thirteen analytes were recovered low in MS and/or MSD of MW-220-VP28. All of the recoveries were low indicating a laboratory spiking error rather than an instrument or matrix issue. The spiking error also resulted in several analytes to exhibit poor precision between the MS and MSD. No qualification of the data was made.

5.0 LABORATORY CONTROL SAMPLE ANALYSIS

The LCS is analyzed to monitor the efficiency of the digestion/extraction procedure and analytical instrument operation. The ability of the laboratory to successfully analyze an LCS demonstrates that there are no analytical problems related to the digestion/sample preparation procedures and/or instrument operations. The LCS results outside QC limits are presented in Table 5 (if applicable). Sporadic and marginal QC failures for multiple component methods do not indicate an analytical concern. If recoveries are high and the compounds are not detected in the samples, then no data qualification is required. All recoveries should be above 10% or the data are flagged “R” as rejected.

REVIEW RESULTS:

All LCS analyses were performed at the required frequency. LCS recoveries were within control limits except as noted on Table 5. Several analytes were outside of acceptance criteria in the LCS. For LCS recoveries that were high and the analyte was not detected in the associated samples, no qualification of the data was made. For recoveries that failed either high

or low and the analyte was detected in the samples, the sample results were qualified J as estimated. If the recovery of the LCS was below acceptance criteria and the analyte was not detected in the samples, the sample results were qualified UJ as estimated non-detect.

IV. COMPOUND IDENTIFICATION AND QUANTITATION

Compounds detected below PQLs in samples should be considered estimated and are qualified "J." The samples with compounds above the linear range were all re-analyzed at a higher dilution factor.

REVIEW RESULTS:

Several samples were diluted due to analytes exceeding the calibration curve for volatiles analysis. Only the analyte exceeding the calibration curve was reported from the dilution.

Five samples were diluted due to the nature of the matrix and target analytes exceeding the calibration curve. All of the analytes were reported at the dilution; therefore, elevated reporting limits were provided.

It was noted in the narrative that tetrachloroethene exhibited a % D greater than 20% in the calibration of batch 1412008. Since tetrachloroethene is a compound of concern, it was requested to be reanalyzed. The results in batch 1412064 confirmed the initial results; therefore, the original results were reported. The results from batch 1412064 were not included in a report issued by TestAmerica.

For total uranium analysis, several samples required dilution and reanalysis to eliminate quenching due to the sample matrix. Several samples were spiked to confirm original results or determine whether quenching occurred. The reported results are considered valid and usable.

V. FIELD DUPLICATE SAMPLE RESULTS

Field duplicate samples were collected and analyzed as an indication of overall precision for both field and laboratory. Field duplicate results are summarized in Table 7 (if applicable). The results are expected to have more variability than laboratory duplicates, which measure only laboratory precision. It is expected also that soil field duplicates will exhibit greater variance than water field duplicates due to the difficulties associated with collecting identical field samples. The QC criteria used to assess field duplicate samples for this project was limits of 40% RPD for waters, or twice the general laboratory duplicate criteria. If both compounds were below the laboratory PQL or one of the compounds was present as a non-detect, then the compounds are

generally not qualified due to field duplicate precision. There are no guidelines regarding data qualification based on poor field duplicate precision. Professional judgment was used to determine whether or not to qualify results.

REVIEW RESULTS:

Field duplicates were collected for an overall project frequency of 10%: 12 field duplicates per 119 samples. The RPD ratings are listed on Table 7 as "Good" if the RPD is less than 40% and as "Poor" if the RPD exceeded 40%. Field duplicate results with "Poor" are flagged "J" as estimated. No qualification of the data was made for analytes exhibiting poor precision where at least one of the sample results was less than the PQL. The sample results for acetone and methylene chloride were qualified U as non-detect due to method blank contamination.

Trichloroethene was qualified J in the parent and field duplicate of sample MW-215-VP20 due to poor precision. Iron and manganese were qualified J in the parent and field duplicate of sample MW-59-VP06 due to poor precision. Total uranium was qualified J in the parent and field duplicate of sample MW-218-VP14 due to poor precision.

Additional Comments

THE LOUIS BERGER GROUP, INC.

FIELD AUDIT CHECKLIST

4/12/16

Project Name: Sylvania FUSRAP	Project Number:
Location: Hicksville, New York	
LBG Personnel: Rachel Malaniak	

Presampling Procedures

1. Are routine/special sampling requirements discussed and documented in the logbook?
   Comments: yes

2. Are personnel assigned as:
   a. Sample custodian (name): Dan Kennedy
   b. Team leader (name): Dan Kennedy
   c. Sampler (name): Stephanie Kromhout; Eric Lambert; Larry Roedl; Tim Dillon
   d. H&S (name): Tim Dillon

3. Does the team member responsible for the following activities known how to complete them:
   a. Sample documentation and inventory yes
   b. Decontamination procedures yes
   c. Photodocumentation yes
   d. Chain-of-custody yes
   e. Sample packaging and shipping yes
   f. Site generated wastes yes
   Comments:

4. Are past problems reviewed, discussed, and solutions identified and documented in the logbook?
   Comments: N/A

5. Are site safety concerns covered during the meeting?
   Comments: yes

Sampling Procedures and Documentation

1. Is a copy of the workplan/sampling plan available so the team members understand the procedures required for sampling and sample collection?
   Comments: yes

2. Do team members know what to do if procedures cannot be used as identified in the sampling plan?
   Comments: yes

3. Have changes in the sampling procedures been noted in the logbook?
   Comments: N/A

4. Does the team have the necessary equipment for collecting appropriate samples?
   Comments: yes

THE LOUIS BERGER GROUP, INC.

FIELD AUDIT CHECKLIST

5. Does the team record appropriate information at the time that the sample is collected? (i.e., sample interval, sample type, composite or grab sample, etc.)
   Comments: yes

6. Are sample jars kept clean during transfer of sample material?
   Comments: yes

7. Are samples preserved as indicated in the sampling plan?
   Comments: yes

8. Are there any visible signs of contamination evident on the sampling equipment?
   Comments: No

Chain-of-Custody

1. Are samples kept in a controlled area (i.e., in a locked location or with a team member) at all times?
   Comments: yes

2. Is all of the sample information (sample type, date, time, etc.) noted on the chain-of-custody?
   Comments: yes

3. Have all samplers signed the chain-of-custody form?
   Comments:

4. Is the Federal Express air bill number listed on the chain-of-custody form?
   Comments:

5. Has a separate team member been assigned to cross check the sample inventory and the chain-of-custody prior to shipment?
   Comments: yes

6. Is the cross check procedure noted in the logbook?
   Comments:

7. Are the sample numbers and Federal Express bill numbers listed in the sample log or the site log-book?
   Comments:

8. Were the labels, logbooks, and chain-of-custody form cross checked?
   Comments:

THE LOUIS BERGER GROUP, INC.

FIELD AUDIT CHECKLIST

Quality Control Samples

1. What QC samples are required (as per sampling plan)?
   Comments: Duplicates, tripblanks, rinse blanks, MS/MSDs

2. What frequency must QC samples be collected? 1 per 20 ms/msDs +Rinse Blanks
   ~~1 per 10 ms/msds~~ 1 per 10 Duplicates; 1 per shipment Trip Blanks

3. Are trip blanks being used?
   Comments: yes

4. Which laboratory provided trip blanks? Test America

5. Are appropriate materials used to generate QC samples?
   Comments: yes

Site Generated Wastes

1. What level of protective clothing is required?
   Level D

2. What equipment is available on site?
   ~~X-52~~, MP-50; WLIs, PIDs, YSI 650

3. Is the equipment calibrated daily and in accordance with appropriate procedures?
   Yes

4. Are calibration data recorded in appropriate logbooks?
   Comments: yes

5. Is data collected according to specific procedures and recorded in the site logbook?
   Comments: yes

Sample Packaging and Shipping

1. Describe sample packaging procedures.
   Same

2. Is packaging done at the end of the day, or as samples are collected?
   Both.

THE LOUIS BERGER GROUP, INC. FIELD AUDIT CHECKLIST
3. Was an inventory conducted for chain-of-custody, logbook, and sample containers? Comments:
4. Are samples packed on ice? Comments: yes
5. Is the proper information being entered on the Federal Express form for billing purposes (i.e., project number and cost code)? Comments:
Personnel Management
1. Is the team leader noting the time that each team member arrives and departs the site in the log-book? Comments: yes
2. Do the weekly time reports reflect the on-site time only? Comments:

NON-CONFORMANCE/QUALITY CONTROL REPORT

Date: April 13, 2016

Organization Name: Louis Berger

Initiator's Name & Title: Rachel Malaniak - Auditor (Louis Berger)

Problem Description:

Steel toe ~~boots~~ + safety glasses where not being worn at ten discussed in H+S meeting. 1 employee not wearing both, another not wearing safety glasses.

ptl was not in equilibration. discuss w/ Dan Kennedy.

Reported To: Erik Gustafson / Dan Kennedy

Corrective Action:

Told staff members to make sure to wear proper safety equipment at all times.

Dan Kennedy discuss w/ staff ptl issue prior to sampling.

Reviewed and Implemented by: X

NON-CONFORMANCE/QUALITY CONTROL REPORT

Date: 3/31/16

Organization Name: Louis Berger Grp

Initiator's Name & Title: Chris Watt, Manager

Problem Description:

Due to expedited TAT, the field team leader is unable review the sample Containers/coolers with the C-O-C prior to sending to the lab. The lab has a courier pick-up the coolers at the drilling site.

Reported To: Erik Gustafson, Field team leader.

Corrective Action:

A. Picture of the C-O-C is taken by the field sampler and sent to the FTL, who then reviews the C-O-C for accuracy & completeness.

Reviewed and Implemented by: Chris WATT and Erik Gustafson.
