The data displayed on this map illustrate the scale of potential flooding, not the exact location, and do not account for future ground elevation, shoreline, or hydrological changes that occurred after the source data was produced. Inundation was assumed to occur at a fix plane above the NAVD88 Datum (i.e., bathtub model) as indicated on the map. All low-lying shaded areas are assumed to be hydrologically "connected." Actual flooding extents may vary due to the temporal characteristics of a coastal flooding event as well as the potential combined effects of rainfall run-off, backflow through existing stormwater infrastructure, and seepage. The line width shown is meant to provide an indication of the proposed placement of the measure, but should not be construed as exact or final, nor is the line width representative of the scale of the CSRM measure.
The data displayed on this map illustrate the scale of potential flooding, not the exact location, and do not account for future ground elevation, shoreline, or hydrological changes that occurred after the source data was produced. Inundation was assumed to occur at a fixed plane above the NAVD88 Datum (i.e., bathtub model) as indicated on the map. All low-lying shaded areas are assumed to be hydrologically "connected." Actual flooding extents may vary due to the temporal characteristics of a coastal flooding event as well as the potential combined effects of rainfall runoff, backflow through existing stormwater infrastructure, and seepage. The line width shown is meant to provide an indication of the proposed placement of the CSRM measure. The line width does not represent the scale of the CSRM measure.
